1 Introduction

It has long been known that there are potentials for which a given Hamiltonian system in classical mechanics admits a solution via separation of variables in more than one coordinate system [6]. The methodical search for such potentials was initiated by Smorodinsky, Winternitz et. al. in two and three dimensions, [9, 10, 21]. A subset of such systems is called *maximal* in dimension N if there exist $2N - 1$ functionally independent integrals of motion. In some papers, such systems are called *superintegrable*, [8]. In this work we examine the basis functions for those classical and quantum mechanical systems in two dimensions which admit separation of variables in at least two coordinate systems. We do this for the corresponding systems defined in Euclidean space and on the two dimensional sphere. In a subsequent work we shall study systems defined in two dimensional hyperbolic spaces and in complex two dimensional spaces.

For each of the superintegrable systems we observe that, for the discrete spectrum of the quantum mechanical Hamiltonian, one can consider this operator as acting on a space of polynomials [20]. Each eigenvalue is multiply degenerate. However, each separable coordinate system gives rise to an orthonormal basis of polynomial eigenfunctions in this space and breaks the degeneracy. These bases are characterized as simultaneous eigenfunctions of second order symmetry operators for the Hamiltonian [23]. We show that under commutation these symmetry operators close to form a quadratic algebra. The superintegral systems are of two types: the "normal type" in which the original Hamiltonian is diagonalized, and the "conformal type" in which the Hamiltonian is modified by multiplying the eigenvalue equation by a function and considering the energy as fixed. The modified equation is then interpreted as the eigenvalue equation for a Hamiltonian on a conformal Euclidean space with a "charge" as the eigenvalue. We present all of these cases from a unified point of view. In particular, all of the special functions that arise via variable separation have their essential features expressed in terms of their zeros. The principal new results are the details of the polynomial bases for each of the nonsubgroup bases, not just the subgroup cartesian and polar coordinate cases, and the details of the structure of the quadratic algebras. (For those coordinate systems which correspond to subgroup type coordinates, the finite solutions have already been found. The contribution of this article is to indicate how the remaining finite solutions can be obtained. This invariably involves the use of a Niven type ansatz for the finite solutions; every quantity of interest can be computed in terms of the zeros of the corresponding polynomial solutions.) For the sake of completeness we list all the finite solutions that are possible. We analyse each of the potentials systematically.

In §2 and §3 we consider the superintegrable systems in Euclidean 2-space and on the 2-dimensional sphere, respectively. In §4 we examine the polynomial eigenfunctions in elliptic coordinates of the n -dimensional isotropic quantum oscillator.

2 Two-dimensional Euclidean space

As is well known [6, 23] there are exactly four coordinate systems on the Euclidean plane in which the free particle Schrödinger equation separates: Cartesian, polar, parabolic and elliptic. We describe these coordinate systems. Let x and y be the Cartesian coordinates.

Polar Coordinates are defined by

$$\begin{aligned} x &= r \cos \theta, & r &> 0, \\ y &= r \sin \theta, & 0 &\leq \theta < 2\pi. \end{aligned} \quad (1)$$

Parabolic Coordinates. We can define two mutually perpendicular parabolic systems:

$$x = \frac{1}{2}(\xi^2 - \eta^2), \quad y = \xi\eta, \quad \xi \in \mathbf{R}, \eta > 0 \quad (2)$$

and

$$x = \bar{\xi}\bar{\eta}, \quad y = \frac{1}{2}(\bar{\xi}^2 - \bar{\eta}^2), \quad \bar{\xi} \in \mathbf{R}, \bar{\eta} > 0 \quad (3)$$

The connection $(\xi, \eta) \mapsto (\bar{\xi}, \bar{\eta})$ is a rotation of angle $\pi/4$ in the (ξ, η) space. The transformation $(x, y) \mapsto (\xi, \eta)$ actually is the two-dimensional realization of the Levi-Civita transformation [19] which has the form:

$$x = \xi^2 - \eta^2, \quad y = 2\xi\eta, \quad \xi \in \mathbf{R}, \eta > 0. \quad (4)$$

Elliptic Coordinates in algebraic form are defined by $(e_1 < u_1 < e_2 < u_2)$

$$x^2 = \frac{(u_1 - e_1)(u_2 - e_1)}{e_2 - e_1}, \quad y^2 = \frac{(u_1 - e_2)(u_2 - e_2)}{e_1 - e_2}. \quad (5)$$

Replacing $x \mapsto x + \sqrt{e_2 - e_1}$ yields a coordinate system which is called *elliptic II coordinates* [12]:

$$x = \sqrt{\frac{(u_1 - e_1)(u_2 - e_1)}{e_2 - e_1}} + \sqrt{e_2 - e_1}, \quad y = \sqrt{\frac{(u_1 - e_2)(u_2 - e_2)}{e_1 - e_2}}. \quad (6)$$

It is interesting that the two elliptic coordinates are connected by the Levi-Civita transformation. Indeed, if we use parabolic coordinates (ξ, η) in Eq (4) as Cartesian coordinates in Eq (5), we have

$$x = \sqrt{\frac{(\bar{u}_1 - \bar{e}_1)(\bar{u}_2 - \bar{e}_1)}{\bar{e}_2 - \bar{e}_1}} + \sqrt{\bar{e}_2 - \bar{e}_1}, \quad y = \sqrt{\frac{(\bar{u}_1 - \bar{e}_2)(\bar{u}_2 - \bar{e}_2)}{\bar{e}_1 - \bar{e}_2}}, \quad (7)$$

where

$$\bar{u}_i = u_i^2 - u_i(e_1 + e_2); \quad \bar{e}_1 = -\frac{1}{4}(e_1 + e_2)^2; \quad \bar{e}_2 = -e_1e_2. \quad (8)$$

As shown in [9, 10, 21] there are four classes of potentials for which multiple separation occurs in Euclidean space.

We treat the cases in order. In each case the Schrödinger equation is ($\hbar = m = 1$)

$$-\frac{1}{2}\Delta\Psi + V_i(x, y)\Psi = E\Psi, \quad i = 1 \dots 4. \quad (9)$$

2.1 The potential in the first case is

$$V_1(x, y) = \frac{1}{2}\omega^2(x^2 + y^2) + \frac{1}{2}\left(\frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2}\right). \quad (10)$$

Table 1: The two-dimensional superintegrable potentials

Potential $V(x, y)$	Coordinate System
$V_1 = \frac{1}{2}\omega^2(x^2 + y^2) + \frac{1}{2}\left(\frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2}\right)$	Cartesian Polar Elliptic
$V_2 = \frac{1}{2}\omega^2(4x^2 + y^2) + k_1x + \frac{1}{2}\frac{k_2^2 - \frac{1}{4}}{y^2}$	Cartesian Parabolic
$V_3 = -\frac{\alpha}{\sqrt{x^2 + y^2}} + \frac{1}{4}\frac{1}{\sqrt{x^2 + y^2}}\left(\frac{k_1^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} + x} + \frac{k_2^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} - x}\right)$	Polar Elliptic II Parabolic
$V_4 = -\frac{\alpha}{\sqrt{x^2 + y^2}} + \frac{1}{4}\frac{1}{\sqrt{x^2 + y^2}}\left(\beta_1\sqrt{\sqrt{x^2 + y^2} + x} + \beta_2\sqrt{\sqrt{x^2 + y^2} - x}\right)$	Mutually Parabolic

The corresponding Schrödinger equation is ($k_1, k_2 > 0$)

$$\left[\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right]\Psi + \left[2E - \omega^2(x^2 + y^2) - \frac{k_1^2 - \frac{1}{4}}{x^2} - \frac{k_2^2 - \frac{1}{4}}{y^2}\right]\Psi = 0.$$

See [9, 10, 2, 12, 25] for an earlier treatment. This equation separates in three different separable coordinate systems: Cartesian, polar and elliptical coordinates.

If we rewrite the Schrödinger equation by putting

$$\Psi = e^{-\omega(x^2 + y^2)/2} x^{1/2 \pm k_1} y^{1/2 \pm k_2} \Phi(x, y) \quad (11)$$

then the equation for $\Phi(x, y)$ is $Q\Phi = -2E\Phi$ or

$$\left[\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \left(\frac{1 \pm 2k_1}{x} - 2\omega x\right)\frac{\partial}{\partial x} + \left(\frac{1 \pm 2k_2}{y} - 2\omega y\right)\frac{\partial}{\partial y} - 2\omega(2 \pm k_1 \pm k_2)\right]\Phi = -2E\Phi. \quad (12)$$

Clearly the operator Q maps polynomials (in x^2, y^2) into polynomials, without increasing the order. Since the original Hamiltonian is self-adjoint with respect to the measure $dx dy$ in the plane, the operator Q acting on polynomials in x^2, y^2 , is self-adjoint with respect to the measure

$$d\rho(x, y) = e^{-\omega(x^2 + y^2)} x^{1 \pm 2k_1} y^{1 \pm 2k_2} dx dy$$

in the quadrant $x > 0, y > 0$. We assume that the positive sign at the k_i has to be taken if $k_i > \frac{1}{2}$ and both the positive and the negative sign must be taken if $0 < k_i < \frac{1}{2}$, so that the polynomials have finite norm [12].

To find the eigenfunctions in the case of cartesian coordinates we look for separable solutions $\Phi(x, y) = X(x)Y(y)$. Then the separation equation in x becomes

$$\left[\frac{\partial^2}{\partial x^2} + \left(-2\omega + \frac{1 \pm 2k_1}{x^2}\right)x\frac{\partial}{\partial x} - (1 \pm 2k_1)\omega\right]X = 2\lambda_1 X. \quad (13)$$

If we look for solutions of the form

$$X(x) = \prod_{m=1}^q (x^2 - \theta_m)$$

the θ_m must satisfy

$$\omega \theta_\ell = 1 \pm k_1 + 2 \sum_{j \neq \ell} \frac{\theta_j}{\theta_\ell - \theta_j},$$

and

$$\lambda_1 = -\omega(2q \pm k_1 + \frac{1}{2}),$$

where q is a non-negative integer. The solutions are $X(x) = L_q^{k_1}(\omega x^2)$ where $L_n^\alpha(z)$ is a Laguerre polynomial.

Thus the corresponding set of orthonormal eigenfunctions which are normalized in quadrant $x > 0, y > 0$ by

$$\int_0^\infty dx \int_0^\infty dy \Psi_{n_1 n_2}^*(x, y) \Psi_{n_1 n_2}(x, y) = \frac{1}{4} \delta_{n_1 n_1'} \delta_{n_2 n_2'} \quad (14)$$

is

$$\Psi(x, y) \equiv \Psi_{n_1, n_2}^{(k_1, k_2)}(x, y) = \sqrt{\frac{\omega n_1! n_2!}{\Gamma(n_1 \pm k_1 + 1) \Gamma(n_2 \pm k_2 + 1)}} (\sqrt{\omega x})^{\frac{1}{2} \pm k_1} (\sqrt{\omega y})^{\frac{1}{2} \pm k_2} e^{-\frac{\omega}{2}(x^2 + y^2)} L_{n_1}^{\pm k_1}(\omega x^2) L_{n_2}^{\pm k_2}(\omega y^2) \quad (15)$$

where $E_n = \omega(2n \pm k_1 \pm k_2 + 2)$ and $n = n_1 + n_2$ is the principal quantum number.

The corresponding classical operator is

$$L_1 = p_x^2 - \left(\omega^2 x^2 + \frac{k_1^2 - \frac{1}{4}}{x^2} \right).$$

These eigenfunctions satisfy

$$\hat{L}_1 \Psi = \left(\frac{\partial^2}{\partial x^2} - \omega^2 x^2 - \frac{k_1^2 - \frac{1}{4}}{x^2} \right) \Psi = 2\lambda_1 \Psi. \quad (16)$$

In polar coordinates the Schrödinger equation is

$$\left(\frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2}{\partial \theta^2} \right) \Psi + \left[2E - \omega^2 r^2 \Psi - \frac{1}{r^2} \left(\frac{k_1^2 - \frac{1}{4}}{\cos^2 \theta} + \frac{k_2^2 - \frac{1}{4}}{\sin^2 \theta} \right) \right] \Psi = 0.$$

If we write $\Psi = R(r)T(\theta)$ then the separation equation for $T(\theta)$ is

$$\frac{d^2}{d\theta^2} T(\theta) - \left(\frac{k_1^2 - \frac{1}{4}}{\cos^2 \theta} + \frac{k_2^2 - \frac{1}{4}}{\sin^2 \theta} \right) T(\theta) = \lambda T(\theta).$$

If we now put

$$T(\theta) = (\cos \theta)^{1/2 \pm k_1} (\sin \theta)^{1/2 \pm k_2} P(z)$$

where $z = \cos 2\theta$, this separation equation becomes

$$\left\{ (1 - z^2) \frac{\partial^2}{\partial z^2} - [(2 \pm k_1 \pm k_2)z + (\pm k_1 \mp k_2)] \frac{\partial}{\partial z} - \frac{1}{4} [\lambda + (1 \pm k_1 \pm k_2)^2] \right\} P(z) = 0.$$

If we try solutions of the form $P(z) = \prod_{m=1}^q (z - \theta_m)$ we find that the zeros of the polynomial $P(z)$ satisfy

$$2 \sum_{m \neq \ell} \frac{1}{\theta_\ell - \theta_m} = \frac{1 \pm k_2}{(1 - \theta_\ell)} - \frac{1 \pm k_1}{(1 + \theta_\ell)} \quad (17)$$

where $\lambda = -(2q \pm k_1 \pm k_2 + 1)^2$. These are just the equations satisfied by the zeros of the Jacobi polynomials. In fact the solutions of this eigenvalue equation have the form

$$T(\theta) = (\cos \theta)^{1/2 \pm k_1} (\sin \theta)^{1/2 \pm k_2} P_q^{(\pm k_1, \pm k_2)}(\cos 2\theta).$$

The classical constant of the motion is

$$L_2 = (xp_y - yp_x)^2 - \left[\frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} \right] (x^2 + y^2)$$

and the corresponding eigenvalue equation satisfied by the eigenfunctions Ψ is

$$\hat{L}_2 \Psi = \left[\left(x \frac{\partial}{\partial y} - y \frac{\partial}{\partial x} \right)^2 + \left(\frac{1}{4} - \frac{k_1^2}{x^2} + \frac{1}{4} - \frac{k_2^2}{y^2} \right) (x^2 + y^2) \right] \Psi = \lambda \Psi. \quad (18)$$

The orthonormal [as in eq. (14)] eigenfunctions in these coordinates are

$$\Psi(r, \theta) \equiv \Psi_{n_r, q}^{(\pm k_1, \pm k_2)}(r, \theta) = \Phi_q^{(\pm k_1, \pm k_2)}(\theta) \sqrt{\frac{2\omega n_r!}{\Gamma(n_r + 2q \pm k_1 \pm k_2 + 1)}} e^{-\frac{\omega r^2}{2}} (\sqrt{\omega r})^{(2q \pm k_1 \pm k_2 + 1)} L_{n_r}^{2q \pm k_1 \pm k_2 + 1}(\omega r^2), \quad (19)$$

where

$$\Phi_q^{(\pm k_1, \pm k_2)}(\theta) = \sqrt{\frac{(2q \pm k_1 \pm k_2 + 1)q! \Gamma(q \pm k_1 \pm k_2 + 1)}{2\Gamma(q \pm k_2 + 1)\Gamma(q \pm k_1 + 1)}} \times (\cos \theta)^{1/2 \pm k_1} (\sin \theta)^{1/2 \pm k_2} P_q^{(\pm k_1, \pm k_2)}(\cos 2\theta) \quad (20)$$

and $E = \omega(2n \pm k_1 \pm k_2 + 2)$, with $n = n_r + q$. Using (11) we can easily split off the polynomial portion of (20) from the multiplier.

In elliptical coordinates we adopt a similar approach. Using the identity

$$\frac{x^2}{\theta - e_1} + \frac{y^2}{\theta - e_2} - 1 = -\frac{(u_1 - \theta)(u_2 - \theta)}{(\theta - e_1)(\theta - e_2)}, \quad (21)$$

we look for solutions (11) of the form [26]

$$\Phi(x, y) = \prod_{m=1}^n \left(\frac{x^2}{\theta_m - e_1} + \frac{y^2}{\theta_m - e_2} - 1 \right).$$

The θ_m must satisfy

$$\frac{1 \pm k_1}{\theta_m - e_1} + \frac{1 \pm k_2}{\theta_m - e_2} + \sum_{j \neq m} \frac{2}{(\theta_m - \theta_j)} - \omega = 0 \quad (22)$$

where $E = \omega(2n \pm k_1 \pm k_2 + 2)$. If we write the Schrödinger equation for this potential in elliptical coordinates we obtain

$$\frac{4(u_1 - e_1)(u_1 - e_2)}{u_1 - u_2} \left[\frac{\partial^2 \Psi}{\partial u_1^2} + \frac{1}{2} \left(\frac{1}{u_1 - e_1} + \frac{1}{u_1 - e_2} \right) \frac{\partial \Psi}{\partial u_1} \right] +$$

$$\frac{4(u_2 - e_1)(u_2 - e_2)}{u_2 - u_1} \left[\frac{\partial^2 \Psi}{\partial u_2^2} + \frac{1}{2} \left(\frac{1}{u_2 - e_1} + \frac{1}{u_2 - e_2} \right) \frac{\partial \Psi}{\partial u_2} \right] + \left[2E - \omega^2(u_1 + u_2 - e_1 - e_2) + \frac{(\frac{1}{4} - k_1^2)(e_2 - e_1)}{(u_1 - e_1)(u_2 - e_1)} + \frac{(\frac{1}{4} - k_2^2)(e_1 - e_2)}{(u_1 - e_2)(u_2 - e_2)} \right] \Psi = 0.$$

This equation admits separable solutions $\Psi = U_1(u_1)U_2(u_2)$ and separation equations

$$\left\{ 4(u_i - e_1)(u_i - e_2) \left[\frac{\partial^2}{\partial u_i^2} + \frac{1}{2} \left(\frac{1}{u_i - e_1} + \frac{1}{u_i - e_2} \right) \frac{\partial}{\partial u_i} \right] - \omega^2[u_i^2 - (e_1 + e_2)u_i] + \frac{(k_1^2 - \frac{1}{4})(e_1 - e_2)}{(u_1 - e_1)} + \frac{(k_2^2 - \frac{1}{4})(e_2 - e_1)}{(u_1 - e_2)} + 2Eu_i + \lambda \right\} U_i(u_i) = 0, \quad i = 1, 2.$$

The additional operator describing this coordinate system is

$$\begin{aligned} \hat{L}_3 \Psi &= \frac{4u_2(u_1 - e_1)(u_1 - e_2)}{u_1 - u_2} \left[\frac{\partial^2 \Psi}{\partial u_1^2} + \frac{1}{2} \left(\frac{1}{u_1 - e_1} + \frac{1}{u_1 - e_2} \right) \frac{\partial \Psi}{\partial u_1} \right] \\ &+ \frac{4u_1(u_2 - e_1)(u_2 - e_2)}{u_2 - u_1} \left[\frac{\partial^2 \Psi}{\partial u_2^2} + \frac{1}{2} \left(\frac{1}{u_2 - e_1} + \frac{1}{u_2 - e_2} \right) \frac{\partial \Psi}{\partial u_2} \right] \\ &+ \left[-u_1 u_2 \omega^2 + \frac{(k_1^2 - \frac{1}{4})(e_1 - e_2)}{(u_1 - e_1)(u_2 - e_1)} + \frac{(k_2^2 - \frac{1}{4})(e_1 - e_2)}{(u_1 - e_2)(u_2 - e_2)} \right] \Psi \\ &= \left[\left(x \frac{\partial}{\partial y} - y \frac{\partial}{\partial x} \right)^2 + e_2 \frac{\partial^2}{\partial x^2} + e_1 \frac{\partial^2}{\partial y^2} - \omega^2(e_2 x^2 + e_1 y^2 + e_1 e_2) \right. \\ &\quad \left. + \frac{\frac{1}{4} - k_1^2}{x^2} (x^2 + y^2 + e_2) + \frac{\frac{1}{4} - k_2^2}{y^2} (x^2 + y^2 + e_1) \right] \Psi = \lambda \Psi \end{aligned} \quad (23)$$

where

$$\lambda = -(1 \pm k_1 \pm k_2)^2 - 2e_2 \omega(1 \pm k_1) - 2e_1 \omega(1 \pm k_2) - \omega^2 e_1 e_2 - 4 \sum_{m=1}^n \left[e_2 \frac{1 \pm k_1}{\theta_m - e_1} + e_1 \frac{1 \pm k_2}{\theta_m - e_2} \right].$$

The corresponding classical operator is

$$\begin{aligned} L_3 &= (x p_y - y p_x)^2 + e_2 p_x^2 + e_1 p_y^2 - \omega^2(e_2 x^2 + e_1 y^2 + e_1 e_2) \\ &+ \frac{(\frac{1}{4} - k_1^2)}{x^2} (x^2 + y^2 + e_2) + \frac{(\frac{1}{4} - k_2^2)}{y^2} (x^2 + y^2 + e_1). \end{aligned} \quad (24)$$

If we now use the redefined operators

$$M_1 = L_1, \quad M_2 = L_2 - \frac{1}{2} + k_1^2 + k_2^2, \quad M_3 = L_3 - \frac{1}{2} + k_1^2 + k_2^2$$

and

$$H = p_x^2 + p_y^2 - \omega^2(x^2 + y^2) + \frac{\frac{1}{4} - k_1^2}{x^2} + \frac{\frac{1}{4} - k_2^2}{y^2},$$

we observe the following relations:

$$M_{12} = \{M_1, M_2\} = 4(x p_y - y p_x)(p_x p_y - \omega^2 x y) + \frac{\frac{1}{4} - k_2^2}{y^2} x p_x - \frac{\frac{1}{4} - k_1^2}{x^2} y p_y, \quad (25)$$

$$\{M_{12}, M_1\} = 8(M_1^2 - M_1 H) - 16\omega^2 M_2, \quad (26)$$

$$\{M_{12}, M_2\} = 8M_2(H - 2M_1) - 4(1 - 4k_2^2)M_2 + 4(1 - 4k_1^2)(H - M_1), \quad (27)$$

$M_{12}^2 = 16M_1 M_2 (H - M_1) + 16\omega^2 L_2^2 - 4(1 - 4k_2^2)M_1^2 - 4(1 - 4k_1^2)(H - M_1)^2 + 4\omega^2(1 - 4k_1^2)(1 - 4k_2^2)$. We have not included M_3 in these calculations as it is linearly dependent on H, M_1 and M_2 via the relation $M_3 = M_2 + (e_2 - e_1)M_1 + e_1 H$. The constants of the motion M_1, M_2 and H generate a quadratic algebra.

2.2 The potential is now

$$V_2(x, y) = \frac{1}{2}\omega^2(4x^2 + y^2) + k_1 x + \frac{1}{2} \frac{k_2^2 - \frac{1}{4}}{y^2}. \quad (28)$$

For $k_1 = 0$ this potential also known as a Holt potential [14]. The Schrödinger equation for $k_1 = 0$ has the form ($k_2 > 0$)

$$\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) \Psi - \left[\omega^2(4x^2 + y^2) + \frac{k_2^2 - \frac{1}{4}}{y^2} \right] \Psi = -2E\Psi.$$

There are two coordinate systems of relevance here, Cartesian coordinates x, y and parabolic coordinates ξ, η . If we express solutions of the Schrödinger equations in the form

$$\Psi = e^{-\omega x^2 - \omega y^2 / 2} y^{1/2 \pm k_2} \Phi(x, y), \quad (29)$$

then the function $\Phi(x, y)$ satisfies the equation $R\Phi = -2E\Phi$ or

$$\left[\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{(1 \pm 2k_2)}{y} \frac{\partial}{\partial y} - 2\omega(2x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y}) - 2\omega(2 \pm k_2) \right] \Phi(x, y) = -2E\Phi. \quad (30)$$

It follows that the operator R maps polynomials (in x, y^2) into polynomials, without increasing the order. Since the original Hamiltonian is self-adjoint with respect to the measure $dx dy$ in the plane, the operator R , acting on polynomials in x, y^2 is self-adjoint with respect to the measure

$$d\rho(x, y) = e^{-\omega(x^2 + y^2)} y^{1 \pm 2k_2} dx dy$$

in the upper half plane $y > 0$. We assume that the positive sign at the k_2 has to be taken if $k_2 > \frac{1}{2}$ and both the positive and the negative sign must be taken if $0 < k_2 < \frac{1}{2}$, so that the polynomials have finite norm [12].

Equation (30) admits a separable solution of the form $\Phi = X(x)Y(y)$ where the function $X(x)$ satisfies the separation equation

$$\left[\frac{\partial^2}{\partial x^2} - 4\omega x \frac{\partial}{\partial x} - 2\omega - \lambda \right] X = 0.$$

If we try solutions of the form $X = \prod_{m=1}^n (x - \theta_m)$ the relations among the θ_m are

$$4\omega \theta_l = \sum_{m \neq l} \frac{1}{\theta_l - \theta_m} \quad (31)$$

and the eigenvalues are $\lambda = -2\omega(2n_1 + 1)$ with solutions $X = H_{n_1}(\sqrt{2\omega}x)$. The solutions for the function $Y(y)$ correspond exactly to those given for the potential V_1 viz

$$Y(y) = L_{n_2}^{\pm k_2}(y^2).$$

The orthonormal eigenfunctions are

$$\Psi \equiv \Psi_{n_1, n_2}(x, y) = \sqrt{2\omega}^{\frac{1}{2}(1 \pm k_2)} \frac{n_2!}{\Gamma(n_2 \pm k_2 + 1)} y^{\frac{1}{2} \pm k_2} e^{-\frac{1}{2}\omega y^2} L_{n_2}^{\pm k_2}(\omega y^2) \times \left(\frac{2\omega}{\pi}\right)^{1/4} \frac{1}{\sqrt{2^{n_1} n_1!}} e^{-\omega x^2} H_{n_1}(\sqrt{2\omega}x). \quad (32)$$

and the energy E takes the values $E = \omega[2(n_1 + n_2) \pm k_2 + 2]$.

In the case of *parabolic coordinates* we note that

$$\frac{y^2}{\lambda^2} + 2x - \lambda^2 = \frac{(\xi^2 - \lambda^2)(\eta^2 + \lambda^2)}{\lambda^2}.$$

If we try a solution of (30) in the form

$$\Phi(x, y) = \prod_{\ell=1}^n \left(\frac{y^2}{\lambda_\ell^2} + 2x - \lambda_\ell^2 \right) \quad (33)$$

it follows that the λ_ℓ must satisfy

$$\frac{1}{\lambda_\ell^2} + \sum_{m \neq \ell} \frac{4}{\lambda_\ell^2 - \lambda_m^2} - 2\omega \lambda_\ell^2 = 0$$

and $E = \omega(2n \pm k_2 + 2)$.

The Schrödinger equation written in terms of parabolic coordinates is

$$\frac{1}{\xi^2 + \eta^2} \left(\frac{\partial^2 \Psi}{\partial \xi^2} + \frac{\partial^2 \Psi}{\partial \eta^2} \right) + \left[2E - \omega^2(\xi^4 - \xi^2\eta^2 + \eta^4) + \frac{1}{4} - \frac{k_2^2}{\xi^2\eta^2} \right] \Psi = 0. \quad (34)$$

If we look for separable solutions of the form $\Psi = X_1(\xi)X_2(\eta)$ the separation equations are

$$\left[\frac{\partial^2}{\partial \mu^2} + \left(-\omega^2\mu^6 + \frac{1}{4} - \frac{k_2^2}{\mu^2} + 2E\mu^2 + \lambda \right) \right] X_j = 0,$$

where $\mu = \xi$ if $j = 1$ and $\mu = \eta$ if $j = 2$. The operator whose eigenvalue is λ is

$$\begin{aligned} \hat{L}_2 \Psi &= \frac{1}{\xi^2 + \eta^2} \left[\xi^2 \frac{\partial^2 \Psi}{\partial \eta^2} - \eta^2 \frac{\partial^2 \Psi}{\partial \xi^2} \right] + [\omega^2 \xi^2 \eta^2 + \frac{1}{4} - \frac{k_2^2}{\xi^2 \eta^2}] (\xi^2 - \eta^2) \Psi \\ &= 2x \frac{\partial^2 \Psi}{\partial y^2} - 2y \frac{\partial^2 \Psi}{\partial x \partial y} - \frac{\partial \Psi}{\partial x} + [2\omega^2 xy^2 + \frac{1}{4} - \frac{k_2^2}{y^2}] \Psi. \end{aligned} \quad (35)$$

The eigenvalues are

$$\lambda = 2(1 \pm k_2) \prod_{j=1}^q \lambda_j^2 \left(\sum_{m=1}^q \lambda_m^{-2} \right).$$

If we define the classical operators associated with this separable system as

$$H = p_x^2 + p_y^2 - \omega^2(4x^2 + y^2) + \frac{1}{4} - \frac{k_2^2}{y^2},$$

$$L_1 = p_x^2 - 4\omega^2 x^2, \quad L_2 = 2p_y(xp_y - yp_x) + 2\omega^2 xy^2 + \frac{1}{4} - \frac{k_2^2}{y^2} x,$$

then the defining relations of the quadratic algebra are

$$\begin{aligned} L_{12} = \{L_1, L_2\} &= 4[p_x p_y^2 + \omega^2 y^2 p_x + 2\frac{1}{4} - \frac{k_2^2}{y^2} p_x - 4\omega^2 xy p_y], \\ \{L_2, L_{12}\} &= 16L_1(H - L_1) - 8(H - L_1)^2 - 8\omega^2(1 - 4k_2^2), \\ \{L_1, L_{12}\} &= -16\omega^2 L_2, \\ L_{12}^2 &= 16(H - L_1)^2 L_1 + 16\omega^2 L_2^2 + 16\omega^2(1 - 4k_2^2). \end{aligned} \quad (36)$$

2.3 The potential is now $(k_1, k_2 > 0)$

$$V_3 = \frac{-\alpha}{\sqrt{x^2 + y^2}} + \frac{1}{4\sqrt{x^2 + y^2}} \left[\frac{k_1^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} + x} + \frac{k_2^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} - x} \right]. \quad (37)$$

The Schrödinger equation separates variables in polar coordinates, parabolic coordinates and modified elliptic coordinates. If we look for solutions of the Schrödinger equation of the form

$$\Psi = e^{-\frac{1}{2}\sqrt{-2E}(\xi^2 + \eta^2)} \xi^{1/2 \pm k_1} \eta^{1/2 \pm k_2} \Phi(\xi, \eta), \quad (38)$$

where ξ, η are *parabolic coordinates*, we find that the equation for $\Phi(\xi, \eta)$ is $S\Phi = -4\alpha\Phi$ or

$$\begin{aligned} \left[\frac{\partial^2 \Phi}{\partial \xi^2} + \frac{\partial^2 \Phi}{\partial \eta^2} + \frac{(1 \pm 2k_1)}{\xi} \frac{\partial \Phi}{\partial \xi} + \frac{(1 \pm 2k_2)}{\eta} \frac{\partial \Phi}{\partial \eta} + 2\sqrt{-2E} \left(\xi \frac{\partial \Phi}{\partial \xi} + \eta \frac{\partial \Phi}{\partial \eta} \right) \right. \\ \left. - 2\sqrt{-2E}(2 \pm k_1 \pm k_2) \right] \Phi = -4\alpha\Phi. \end{aligned} \quad (39)$$

For fixed E we can consider this as an eigenvalue equation for S with eigenvalue -4α . Moreover S maps polynomials (in ξ^2, η^2 or, what is the same thing, in $r = \sqrt{x^2 + y^2}, x$) into polynomials, without increasing the order. Since the original Hamiltonian is self-adjoint with respect to the measure $dx dy$ in the plane, the operator S , acting on polynomials in ξ^2, η^2 is self-adjoint with respect to the measure

$$d\rho(x, y) = e^{-\sqrt{-2E}(\xi^2 + \eta^2)} \xi^{1 \pm 2k_1} \eta^{1 \pm 2k_2} (\xi^2 + \eta^2) d\xi d\eta.$$

We assume that the positive sign at the k_i has to be taken if $k_i > \frac{1}{2}$ and both the positive and the negative sign must be taken if $0 < k_i < \frac{1}{2}$, so that the polynomials have finite norm [12]. For polynomial eigenfunctions we must have the quantisation condition

$$2\alpha = \sqrt{-2E}[2(q+1) \pm k_1 \pm k_2] \quad (40)$$

for integer q .

In *polar coordinates* with potential V_3 the Schrödinger equation has the form

$$\left[\frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2}{\partial \theta^2} \right] \Psi + \left[2E + \frac{2\alpha}{r} + \frac{1}{2r^2} \left(\frac{1-k_1^2}{1+\cos\theta} + \frac{1-k_2^2}{1-\cos\theta} \right) \right] \Psi = 0.$$

If we write solutions Ψ in the form

$$\Psi = R(r)S(\theta)$$

the θ separation equation is

$$\frac{d^2}{d\theta^2} S(\theta) + \frac{1}{16} \left[\frac{1-4k_1^2}{\cos^2(\frac{\theta}{2})} + \frac{1-4k_2^2}{\sin^2(\frac{\theta}{2})} \right] S(\theta) = -\lambda^2 S(\theta), \quad (41)$$

which has solutions

$$S(\theta) = \left(\sin \frac{\theta}{2} \right)^{\frac{1}{2} \pm k_2} \left(\cos \frac{\theta}{2} \right)^{\frac{1}{2} \pm k_1} P_m^{(\pm k_1, \pm k_2)}(\cos \theta)$$

where $\lambda = m + \frac{1}{2}(1 \pm k_1 \pm k_2)$. The separation equation for $R(r)$ is

$$\left[\frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} - \frac{\lambda^2}{r^2} + \frac{2\alpha}{r} + 2E \right] R(r) = 0 \quad (42)$$

which has the solution

$$R_{n_r, \lambda}(r) = e^{-\sqrt{-2E}r} (2\sqrt{-2E}r)^\lambda L_{n_r}^\lambda(2\sqrt{-2E}r)$$

where

$$E = -\frac{\alpha^2}{2(n_r + \lambda + 1/2)^2}.$$

The orthonormal basis of eigenfunctions is

$$\Psi_{n_r, m}(r, \theta) = \sqrt{\frac{\alpha n_r!}{\Gamma(2n_r + 2\lambda + 1)\Gamma(2n_r + 2\lambda + 1)}} R_{n_r, \lambda}(r) \Phi_m^{(\pm k_2, \pm k_1)}(\theta/2). \quad (43)$$

The operator whose eigenvalue is λ^2 is, in cartesian coordinates,

$$L_1 = \left[\left(x \frac{\partial}{\partial y} - y \frac{\partial}{\partial x} \right)^2 - \frac{1}{2} \sqrt{x^2 + y^2} \left(\frac{k_1^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} + x} + \frac{k_2^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} - x} \right) \right]. \quad (44)$$

In *parabolic coordinates* Schrödinger's equation has the form

$$H\Psi = \frac{1}{\xi^2 + \eta^2} \left[\frac{\partial^2 \Psi}{\partial \xi^2} + \frac{\partial^2 \Psi}{\partial \eta^2} \right] + \left[4\alpha + \left(\frac{1-k_1^2}{\xi^2} + \frac{1-k_2^2}{\eta^2} \right) \right] \Psi = -2E\Psi.$$

The separation equations are

$$\frac{\partial^2}{\partial \mu^2} X_j + \left(\frac{1-k_j^2}{\mu^2} + 2E\mu^2 + \lambda_j \right) X_j = 0 \quad (45)$$

with $\lambda_1 + \lambda_2 = 4\alpha$. The orthonormal bound state eigenfunctions of Schrödinger's equation in these coordinates are

$$\Psi = X_1(\xi)X_2(\eta) = \sqrt{\frac{\alpha n_1! n_2!}{[2(n_1 + n_2) \pm k_1 \pm k_2 + 2]^3 \Gamma(n_1 \pm k_1 + 1) \Gamma(n_2 \pm k_2 + 1)}} e^{-\frac{1}{2}\sqrt{-2E}(\xi^2 + \eta^2)} (\sqrt{-2E}\xi)^{1/2 \pm k_1} (\sqrt{-2E}\eta)^{1/2 \pm k_2} L_{n_1}^{\pm k_1}(\sqrt{-2E}\xi^2) L_{n_2}^{\pm k_2}(\sqrt{-2E}\eta^2) \quad (46)$$

where $\lambda_j = 2\sqrt{-2E}(2n_j \pm k_j + 1)$, $j = 1, 2$, and

$$E = -\frac{\alpha^2}{2[n_1 + n_2 + (2 \pm k_1 \pm k_2)/2]^2}.$$

If we choose $\lambda_1 = 2\alpha + \lambda$ and $\lambda_2 = 2\alpha - \lambda$ then the symmetry operator with eigenvalue λ is

$$L_2 = 2x \frac{\partial^2}{\partial y^2} - 2y \frac{\partial^2}{\partial x \partial y} - \frac{\partial}{\partial x} - \left[(k_1^2 - \frac{1}{4}) \frac{\sqrt{x^2 + y^2} - x}{\sqrt{x^2 + y^2}(\sqrt{x^2 + y^2} + x)} - (k_2^2 - \frac{1}{4}) \frac{\sqrt{x^2 + y^2} + x}{\sqrt{x^2 + y^2}(\sqrt{x^2 + y^2} - x)} - \frac{4\alpha}{\sqrt{x^2 + y^2}} \right] \\ = \frac{1}{\xi^2 + \eta^2} \left[\xi^2 \frac{\partial^2}{\partial \eta^2} - \eta^2 \frac{\partial^2}{\partial \xi^2} \right] + \left[\left(\frac{1}{4} - k_1^2 \right) \frac{\eta^2}{\xi^2(\xi^2 + \eta^2)} + \left(k_2^2 - \frac{1}{4} \right) \frac{\xi^2}{\eta^2(\xi^2 + \eta^2)} + 2\alpha \frac{\xi^2 - \eta^2}{\xi^2 + \eta^2} \right].$$

For the case of *elliptical coordinates* we proceed as follows. The normal elliptical coordinates will not separate variables. However, if we compare (12) and (2) we are motivated to choose coordinates such that

$$\xi^2 = \frac{(u_1 - e_1)(u_2 - e_1)}{e_1 - e_2}, \quad \eta^2 = \frac{(u_1 - e_2)(u_2 - e_2)}{e_2 - e_1}. \quad (47)$$

If we then try a solution of (2) in the form

$$\Phi(\xi, \eta) = \prod_{m=1}^n \left[\frac{\xi^2}{\theta_m - e_1} + \frac{\eta^2}{\theta_m - e_2} - 1 \right], \quad (48)$$

we see that the θ_m must satisfy

$$\frac{1 \pm k_1}{\theta_m - e_1} + \frac{1 \pm k_2}{\theta_m - e_2} + \sum_{j \neq m} \frac{2}{\theta_m - \theta_j} - \sqrt{-2E} = 0,$$

and the quantisation condition (40). In this choice of coordinates the Schrödinger equation has the form

$$\frac{4(u_1 - e_1)(u_2 - e_2)}{u_1 - u_2} \left[\frac{\partial^2 \Phi}{\partial u_1^2} + \frac{1}{2} \left(\frac{1}{u_1 - e_1} + \frac{1}{u_1 - e_2} \right) \frac{\partial \Phi}{\partial u_1} \right] \\ + \frac{4(u_2 - e_1)(u_2 - e_2)}{u_2 - u_1} \left[\frac{\partial^2 \Phi}{\partial u_2^2} + \frac{1}{2} \left(\frac{1}{u_2 - e_1} + \frac{1}{u_2 - e_2} \right) \frac{\partial \Phi}{\partial u_2} \right] \\ + \left[2E(u_1 + u_2 - e_1 - e_2) + \frac{(\frac{1}{4} - k_1^2)(e_2 - e_1)}{(u_1 - e_1)(u_2 - e_1)} + \frac{(\frac{1}{4} - k_2^2)(e_1 - e_2)}{(u_1 - e_2)(u_2 - e_2)} + 4\alpha \right] \Phi = 0.$$

This equation admits separable solutions $\Phi = U_1(u_1)U_2(u_2)$ and separation equations

$$\left\{ 4(u_i - e_1)(u_i - e_2) \left(\frac{\partial^2}{\partial u_i^2} + \frac{1}{2} \left[\frac{1}{u_i - e_1} + \frac{1}{u_i - e_2} \right] \frac{\partial}{\partial u_i} \right) + 2E[u_i^2 - (e_1 + e_2)u_i] + \frac{(k_i^2 - \frac{1}{4})(e_1 - e_2)}{u_i - e_1} \right. \\ \left. + \frac{(k_i^2 - \frac{1}{4})(e_2 - e_1)}{u_i - e_2} + 4\alpha u_i + \lambda \right\} U_i(u_i) = 0, \quad i = 1, 2. \quad (49)$$

The additional operator describing this coordinate system is

$$\hat{L}_3 = \frac{4}{(u_1 - u_2)(u_1 + u_2 - e_1 - e_2)} \left\{ u_2(u_1 - e_1)(u_1 - e_2) \left(\frac{\partial^2}{\partial u_1^2} + \frac{1}{2} \left[\frac{1}{u_1 - e_1} + \frac{1}{u_1 - e_2} \right] \frac{\partial}{\partial u_1} \right) \right. \\ \left. - u_1(u_2 - e_1)(u_2 - e_2) \left(\frac{\partial^2}{\partial u_2^2} + \frac{1}{2} \left[\frac{1}{u_2 - e_1} + \frac{1}{u_2 - e_2} \right] \frac{\partial}{\partial u_2} \right) \right\} \quad (50) \\ + \frac{k_1^2 - \frac{1}{4}}{(u_1 - e_1)(u_2 - e_1)} \left\{ u_1 + u_2 - e_1 - e_2 - \frac{[(u_1 - e_2)(u_2 - e_2) + e_1 e_2]}{(u_1 + u_2 - e_1 - e_2)} \right\} \\ + \frac{k_2^2 - \frac{1}{4}}{(u_1 - e_2)(u_2 - e_2)} \left\{ u_1 + u_2 - e_1 - e_2 - \frac{[(u_1 - e_1)(u_2 - e_1) + e_1 e_2]}{(u_1 + u_2 - e_1 - e_2)} \right\} \\ + \frac{4\alpha u_1 u_2}{u_1 + u_2 - e_1 - e_2}.$$

In cartesian coordinates the solutions have the form

$$\Psi = e^{-\sqrt{-2E}(x^2+y^2)} (\sqrt{x^2+y^2} + x)^{\frac{1}{2}(1 \pm 2k_1)} (\sqrt{x^2+y^2} - x)^{\frac{1}{2}(1 \pm 2k_2)} \\ \times \prod_{m=1}^n \left(\frac{\sqrt{x^2+y^2} + x}{\theta_m - e_1} + \frac{\sqrt{x^2+y^2} - x}{\theta_m - e_2} - 1 \right). \quad (51)$$

Acting on the functions Ψ the operator L_3 has the form

$$L_3 = \left[\left(\xi \frac{\partial}{\partial \eta} - \eta \frac{\partial}{\partial \xi} \right)^2 + e_2 \frac{\partial^2}{\partial \xi^2} + e_1 \frac{\partial^2}{\partial \eta^2} - (e_2 \xi^2 + e_1 \eta^2 + e_1 e_2) H \right. \\ \left. + \left(\frac{1}{4} - k_1^2 \right) \frac{(\xi^2 + \eta^2 + e_2)}{\xi^2} + \left(\frac{1}{4} - k_2^2 \right) \frac{(\xi^2 + \eta^2 + e_2)}{\eta^2} \right] \\ = \left[-4 \left(x \frac{\partial}{\partial y} - y \frac{\partial}{\partial x} \right)^2 - (e_1 - e_2) \left(2x \frac{\partial^2}{\partial y^2} - 2y \frac{\partial^2}{\partial x \partial y} - \frac{\partial}{\partial x} \right) - e_1 e_2 H \right. \quad (52) \\ \left. - \frac{2\alpha}{\sqrt{x^2+y^2}} [e_1(\sqrt{x^2+y^2} - x) + e_2(\sqrt{x^2+y^2} + x)] \right. \\ \left. - \left(\frac{1}{4} - k_1^2 \right) \frac{(e_1 - e_2)(\sqrt{x^2+y^2} - x)}{2\sqrt{x^2+y^2}(\sqrt{x^2+y^2} + x)} - \left(\frac{1}{4} - k_2^2 \right) \frac{(e_1 - e_2)(\sqrt{x^2+y^2} + x)}{2\sqrt{x^2+y^2}(\sqrt{x^2+y^2} - x)} \right. \\ \left. + \left(\frac{1}{4} - k_1^2 \right) \frac{\sqrt{x^2+y^2} - x}{\sqrt{x^2+y^2} + x} + \left(\frac{1}{4} - k_2^2 \right) \frac{\sqrt{x^2+y^2} + x}{\sqrt{x^2+y^2} - x} + \frac{1}{2} - k_1^2 - k_2^2 \right],$$

where in cartesian coordinates

$$H\Psi = \frac{\partial^2 \Psi}{\partial x^2} + \frac{\partial^2 \Psi}{\partial y^2} + \left[\frac{-\alpha}{\sqrt{x^2+y^2}} + \frac{1}{4\sqrt{x^2+y^2}} \left(\frac{k_1^2 - \frac{1}{4}}{\sqrt{x^2+y^2} + x} + \frac{k_2^2 - \frac{1}{4}}{\sqrt{x^2+y^2} - x} \right) \right] \Psi.$$

The eigenvalues of the operator L_3 are

$$\lambda = -(1 \pm k_1 \pm k_2)^2 - 2\sqrt{-2E}[e_2(1 \pm k_1) - 2e_1(1 \pm k_2)] + 2Ee_1e_2 \\ - 4 \sum_{m=1}^n [e_2 \frac{1 \pm k_1}{\theta_m - e_1} + e_1 \frac{1 \pm k_2}{\theta_m - e_2}]. \quad (53)$$

Indeed the cartesian coordinates in this case can be written in the form (7).

The corresponding quadratic algebra can be generated by the classical constants

$$L_1 = (\xi p_\eta - \eta p_\xi)^2 + (\xi^2 + \eta^2) \left[\frac{1}{4} - \frac{k_1^2}{\xi^2} + \frac{1}{4} - \frac{k_2^2}{\eta^2} \right], \\ L_2 = \frac{1}{\xi^2 + \eta^2} \left[\xi^2 p_\eta^2 - \eta^2 p_\xi^2 - \frac{\eta^2}{\xi^2} \left(\frac{1}{4} - k_1^2 \right) - \frac{\xi^2}{\eta^2} \left(\frac{1}{4} - k_2^2 \right) + 2\alpha(\xi^2 - \eta^2) \right], \\ L_3 = (\xi p_\eta - \eta p_\xi)^2 + e_2 p_\xi^2 + e_1 p_\eta^2 - (e_2 \xi^2 + e_1 \eta^2) H + \left(\frac{1}{4} - k_1^2 \right) \frac{(\xi^2 + \eta^2 + e_2)}{\xi^2} \\ + \left(\frac{1}{4} - k_2^2 \right) \frac{(\xi^2 + \eta^2 + e_2)}{\eta^2}, \\ H = \frac{1}{\xi^2 + \eta^2} [p_\xi^2 + p_\eta^2 + 4\alpha + \left(\frac{1}{4} - \frac{k_1^2}{\xi^2} + \frac{1}{4} - \frac{k_2^2}{\eta^2} \right)].$$

Here, L_1, L_2, L_3 are functionally dependent via the relation

$$L_3^2 = L_1^2 + 2(e_1 - e_2)L_1L_2 + (e_1 - e_2)^2L_2^2 - 2[(k_1 + k_2) + 2(e_1 + e_2)\alpha]L_1 \\ - [4\alpha^2(e_1^2 - e_2^2) + 2(e_1 - e_2)(k_1 + k_2)]L_2 - [k_1 + k_2 + 2\alpha(e_1 + e_2)]^2. \quad (54)$$

The only additional quantity that we need is

$$L_{12} = \{L_1, L_2\} = \frac{1}{\xi^2 + \eta^2} \{ 4(\xi p_\eta - \eta p_\xi)^2 (\xi p_\xi - \eta p_\eta) - 16\xi\eta(\xi p_\eta - \eta p_\xi) + \\ [(4\frac{\xi^3}{\eta^2} + 8\xi)(\frac{1}{4} - k_2^2) + 4\frac{\eta^3}{\xi}(\frac{1}{4} - k_1^2)] p_\xi - [(4\frac{\eta^3}{\xi^2} + 8\eta)(\frac{1}{4} - k_1^2) + 4\frac{\xi^2}{\eta}(\frac{1}{4} - k_2^2)] p_\eta \}.$$

The nontrivial independent commutation relations are

$$\{L_{12}, L_1\} = -16L_1L_2 + 32\alpha(k_1^2 - k_2^2), \quad \{L_{12}, L_2\} = -16HL_1 + 8L_2^2. \quad (55)$$

We should also observe the relations

$$\{L_1, L_3\} = (e_1 - e_2)\{L_1, L_2\}, \quad \{L_1, L_2\} = \{L_3, L_2\}, \\ \{L_{12}, L_3\} = 16(e_1 - e_2)HL_1 - 8(e_1 - e_2)L_2^2 - 16L_1L_2 - 16(e_1 - e_2)H \\ - 32\alpha(\alpha(e_1 - e_2) + (k_1^2 - k_2^2)). \quad (56)$$

2.4 The fourth potential is

$$V_4 = \frac{-\alpha}{\sqrt{x^2+y^2}} + \frac{B_1}{4} \frac{\sqrt{\sqrt{x^2+y^2}+x}}{\sqrt{x^2+y^2}} + \frac{B_2}{4} \frac{\sqrt{\sqrt{x^2+y^2}-x}}{\sqrt{x^2+y^2}}. \quad (57)$$

The corresponding Schrödinger equation separates in two versions of parabolic coordinates.

In *regular parabolic coordinates* (2) the Schrödinger equation has the form

$$\frac{1}{\xi^2 + \eta^2} \left[\frac{\partial^2 \Psi}{\partial \xi^2} + \frac{\partial^2 \Psi}{\partial \eta^2} + (4\alpha - B_1 \xi - B_2 \eta) \Psi \right] = -2E \Psi. \quad (58)$$

If we write the solutions Ψ in the form $X(\xi)Y(\eta)$ the separation equations are

$$\frac{\partial^2 X}{\partial \xi^2} + (2\alpha - \lambda - B_1 \xi + 2E\xi^2)X = 0, \quad \frac{\partial^2 Y}{\partial \eta^2} + (2\alpha + \lambda - B_2 \eta + 2E\eta^2)Y = 0.$$

The solutions of these equations are

$$X(\xi) = e^{\frac{1}{2\sqrt{-2E}}[-2E\xi^2 + B_1\xi]} H_n \left(\sqrt{-2E} \left(\xi - \frac{B_1}{4E} \right) \right) \quad (59)$$

and

$$Y(\eta) = e^{\frac{1}{2\sqrt{-2E}}[-2E\eta^2 + B_2\eta]} H_m \left(\sqrt{-2E} \left(\eta - \frac{B_2}{4E} \right) \right) \quad (60)$$

where

$$2\alpha - \lambda - \frac{B_1^2}{8E} = -(n+1)\sqrt{-2E}, \quad 2\alpha + \lambda - \frac{B_2^2}{8E} = -(m+1)\sqrt{-2E}.$$

From this we see that the energy eigenstates are solutions of

$$4\alpha - \frac{1}{8E}(B_1^2 + B_2^2) = -(m+n+2)\sqrt{-2E}. \quad (61)$$

Moreover it follows from (59) and (60) that

$$\Psi(\xi, \eta) = e^{\frac{1}{2\sqrt{-2E}}[-2E(\xi^2 + \eta^2) + B_1\xi + B_2\eta]} \Phi(\xi, \eta)$$

where Φ is a polynomial in ξ and η . If (58) is written as a differential equation for Φ it can be interpreted as an eigenvalue equation, with eigenvalue -4α , for an E -dependent operator acting on a space of polynomials. The operator whose eigenvalue is λ is

$$\begin{aligned} L_1 &= \frac{1}{\xi^2 + \eta^2} \left\{ \eta^2 \frac{\partial^2}{\partial \xi^2} - \xi^2 \frac{\partial^2}{\partial \eta^2} + [-B_1 \xi \eta^2 + B_2 \eta \xi^2 + 2(\eta^2 - \xi^2)\alpha] \right\} \\ &= \left\{ -2x \frac{\partial^2}{\partial y^2} + 2y \frac{\partial^2}{\partial x \partial y} + \frac{\partial}{\partial x} + \left[\frac{B_1}{2} \sqrt{\sqrt{x^2+y^2}+x} \left(1 - \frac{x}{\sqrt{x^2+y^2}} \right) \right. \right. \\ &\quad \left. \left. + \frac{B_2}{2} \sqrt{\sqrt{x^2+y^2}-x} \left(1 + \frac{x}{\sqrt{x^2+y^2}} \right) - \frac{2x\alpha}{\sqrt{x^2+y^2}} \right] \right\}. \end{aligned} \quad (62)$$

The second coordinate system is a *variant of parabolic coordinates* (3) in terms of which the Schrödinger equation has the form

$$\frac{1}{\mu^2 + \nu^2} \left\{ \frac{\partial^2 \Psi}{\partial \mu^2} + \frac{\partial^2 \Psi}{\partial \nu^2} + \left[4\alpha - \frac{B_1}{\sqrt{2}}(\mu + \nu) - \frac{B_2}{\sqrt{2}}(\mu - \nu) \right] \Psi \right\} = -2E \Psi.$$

The separation equations for $\Psi = X(\mu)Y(\nu)$ are

$$\begin{aligned} \frac{\partial^2 X}{\partial \mu^2} + \left(2\alpha - \lambda - \frac{1}{\sqrt{2}}(B_1 + B_2)\mu + 2E\mu^2 \right) X &= 0, \\ \frac{\partial^2 Y}{\partial \nu^2} + \left(2\alpha + \lambda - \frac{1}{\sqrt{2}}(B_1 - B_2)\nu + 2E\nu^2 \right) Y &= 0. \end{aligned}$$

The operator whose eigenvalue is λ , is

$$\begin{aligned} L_2 &= \frac{1}{\mu^2 + \nu^2} \left[\nu^2 \frac{\partial^2}{\partial \mu^2} - \mu^2 \frac{\partial^2}{\partial \nu^2} - \frac{\mu\nu^2}{\sqrt{2}}(B_1 + B_2) \right. \\ &\quad \left. + \frac{\nu\mu^2}{\sqrt{2}}(B_1 - B_2) + 2(\nu^2 - \mu^2)\alpha \right] = -2y \frac{\partial^2}{\partial x^2} + 2x \frac{\partial^2}{\partial x \partial y} + \frac{\partial}{\partial y} + \\ &\quad \left[-\frac{1}{2\sqrt{2}}(B_1 + B_2) \sqrt{\sqrt{x^2+y^2}+x} \left(1 - \frac{x}{\sqrt{x^2+y^2}} \right) \right. \\ &\quad \left. + \frac{1}{2\sqrt{2}}(B_1 - B_2) \sqrt{\sqrt{x^2+y^2}-x} \left(1 + \frac{x}{\sqrt{x^2+y^2}} \right) - \frac{2x\alpha}{\sqrt{x^2+y^2}} \right]. \end{aligned} \quad (63)$$

The space of polynomials in ξ, η coincides with the space of polynomials in ν, μ . The classical operators associated with this separable system are, using the ξ, η coordinates,

$$L_1 = \frac{1}{\xi^2 + \eta^2} [\eta^2 p_\xi^2 - \xi^2 p_\eta^2 - B_1 \xi \eta^2 + B_2 \eta \xi^2 + 2(\eta^2 - \xi^2)\alpha],$$

$$L_2 = \frac{1}{\xi^2 + \eta^2} [(\xi p_\xi - \eta p_\eta)(\xi p_\eta - \eta p_\xi) - 4\xi \eta \alpha + \frac{1}{2}(\xi^2 - \eta^2)(\eta B_1 - \xi B_2)],$$

$$H = \frac{1}{\xi^2 + \eta^2} [p_\xi^2 + p_\eta^2 + (4\alpha - B_1 \xi - B_2 \eta)],$$

together with

$$L_{12} = \{L_1, L_2\} = \frac{1}{\xi^2 + \eta^2} \{ 2(\xi p_\eta - \eta p_\xi)(p_\xi^2 + p_\eta^2) + 8\alpha(\xi p_\eta - \eta p_\xi) +$$

$$[(\eta^2 - \xi^2)p_\eta + 2\xi \eta p_\xi] B_1 + [(\eta^2 - \xi^2)p_\xi + 2\xi \eta p_\eta] B_2 \}.$$

The defining relations of the quadratic algebra are

$$L_{12}^2 = 4L_1^2 H + 4L_2^2 H - 16\alpha^2 H + (B_2^2 - B_1^2)L_1 - 2B_1 B_2 L_2 - 2\alpha^2 (B_1^2 + B_2^2),$$

$$\{L_{12}, L_1\} = -4L_1^2 H + B_1 B_2, \quad \{L_{12}, L_2\} = 4L_1 H - \frac{1}{2}(B_1^2 - B_2^2). \quad (64)$$

There are of course quantum analogs for all the quadratic algebras that occur for each potential. These operator algebras can be obtained via the replacement of the Poisson bracket by the commutator bracket. (Indeed the relations (2) for the classical version of the algebras remain unchanged under this replacement.) One can ask the question what are the consequences of such an algebra on the eigenfunction spaces of the operators L_1 and L_2 ? Let the eigenspace corresponding to a fixed bound state energy E be of dimension N . This eigenspace can be

spanned by eigenfunctions of both L_1 and L_2 . Let the corresponding eigenvectors be ϕ_m and ψ_m , respectively, satisfying

$$L_1\phi_m = \lambda_m\phi_m, \quad L_2\psi_n = \rho_n\psi_n,$$

where $\lambda_n = 2\alpha - B_1^2/8E - (2n+1)\sqrt{-2E}$ and $\rho_m = 2\alpha - (B_1+B_2)^2/16E - (2m+1)\sqrt{-2E}$. Using the quantum version of the defining relations of the quadratic algebra what can we deduce? If we use the second of the relations (2) acting on ψ_n and write $L_1\psi_n = \sum_{\tau=1}^N C_{n\tau}\psi_\tau$ we deduce that

$$[(\rho_n - \rho_\tau)^2 + 8E]C_{n\tau} = -\frac{1}{2}(B_1^2 - B_2^2) + 16\alpha E \delta_{n\tau}.$$

This relation implies that $C_{nn} = -[\frac{1}{2}(B_1^2 - B_2^2) + 16\alpha E]/8E$ and $C_{pq} \neq 0$ if $|p-q| \leq 1$ and zero otherwise. Here we have used the relation $(\rho_n - \rho_\tau)^2 + 8E = 0$ for $|n-\tau| = 1$. If we apply the second relation to the function ψ_n we obtain the relation

$$\sum_{\tau=1}^N C_{n\tau}C_{\tau\sigma}(2\rho_\tau - \rho_n - \rho_\sigma) = (8E\rho_n + B_1B_2 + 16\alpha E)\delta_{n\sigma}.$$

If we assume that the basis functions ψ_n are orthonormal and observe that the operator L_1 is selfadjoint then we can assume $C_{n+1,n} = C_{n,n+1}^*$. The only nontrivial consequence of this relation is when $n = \sigma$. The result is

$$4\sqrt{-2E}(|C_{n,n+1}|^2 - |C_{n-1,n}|^2) = 8E\rho_n + B_1B_2 + 16\alpha E.$$

If we act on the functions ϕ_m we generate similar relations. In fact, if we write $L_2\phi_m = \sum_{\tau=1}^N D_{m\tau}\phi_\tau$ the corresponding results are

$$D_{nn} = -(B_1B_2 + 16\alpha E)/8E$$

and $D_{pq} \neq 0$ if $|p-q| \leq 1$ and is zero otherwise. Furthermore,

$$4\sqrt{-2E}(|D_{n,n+1}|^2 - |D_{n-1,n}|^2) = -8\lambda_n E - \frac{1}{2}(B_1^2 - B_2^2) - 16\alpha E.$$

From this relations we can, in principle, calculate the matrices C_{pq}, D_{pq} . Once these are known relations are also implied for the matrices relating the two bases. If we denote $\langle \phi_m, \psi_q \rangle = A_{mq}$ then these matrices must satisfy

$$C_{ir} = \sum_{m=1}^N \lambda_m A_{mr}^* A_{mi}, \quad D_{ir} = \sum_{m=1}^N \rho_m A_{mr} A_{mi}^*.$$

From the consequences of the quadratic algebra we see that we can in principle calculate the matrices C_{pq} and D_{pq} as well as the overlap functions A_{rs} . The only ambiguity is in the choice of the phases of the wavefunctions.

3 The two-dimensional sphere

In the case of the two-dimensional sphere there are two potentials that are separable in more than one coordinate system, and these each separate in two systems. To work with the two dimensional sphere it is convenient to use projective coordinates: s_i ($i = 1, 2, 3$), $s_1^2 + s_2^2 + s_3^2 = 1$.

3.1 The first superintegrable potential on the sphere is

$$V_1 = \frac{1}{2} \left(\frac{k_1^2 - \frac{1}{4}}{s_1^2} + \frac{k_2^2 - \frac{1}{4}}{s_2^2} + \frac{k_3^2 - \frac{1}{4}}{s_3^2} \right). \quad (65)$$

In terms of spherical coordinates

$$s_1 = \sin \theta \cos \varphi, \quad s_2 = \sin \theta \sin \varphi, \quad s_3 = \cos \theta \quad (66)$$

the corresponding Schrödinger equation has the form

$$\left[\left(s_1 \frac{\partial}{\partial s_2} - s_2 \frac{\partial}{\partial s_1} \right)^2 + \left(s_1 \frac{\partial}{\partial s_3} - s_3 \frac{\partial}{\partial s_1} \right)^2 + \left(s_3 \frac{\partial}{\partial s_2} - s_2 \frac{\partial}{\partial s_3} \right)^2 \right] \Psi - \left(\frac{k_1^2 - \frac{1}{4}}{s_1^2} + \frac{k_2^2 - \frac{1}{4}}{s_2^2} + \frac{k_3^2 - \frac{1}{4}}{s_3^2} \right) \Psi = -2E\Psi, \quad (67)$$

or, in terms of θ and φ ,

$$\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial \Psi}{\partial \theta} + \frac{1}{\sin^2 \theta} \frac{\partial^2 \Psi}{\partial \varphi^2} + \frac{1}{\sin^2 \theta} \left(\frac{\frac{1}{4} - k_1^2}{\cos^2 \varphi} + \frac{\frac{1}{4} - k_2^2}{\sin^2 \varphi} \right) \Psi + \frac{\frac{1}{4} - k_3^2}{\cos^2 \theta} \Psi = -2E\Psi.$$

This equation admits separable solutions of the form $\Psi = T(\theta)\Phi(\varphi)$ such that

$$\frac{\partial^2 \Phi}{\partial \varphi^2} + \left(\frac{\frac{1}{4} - k_1^2}{\cos^2 \varphi} + \frac{\frac{1}{4} - k_2^2}{\sin^2 \varphi} \right) \Phi = -\lambda^2 \Phi,$$

$$\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial T}{\partial \theta} - \left(\frac{\lambda^2}{\sin^2 \theta} + \frac{k_3^2 - \frac{1}{4}}{\cos^2 \theta} \right) T = -2ET.$$

These equations have the solutions

$$\Phi(\varphi) = (\sin \varphi)^{k_2 + \frac{1}{2}} (\cos \varphi)^{k_1 + \frac{1}{2}} P_n^{(k_2, k_1)}(\cos 2\varphi)$$

where $\lambda = (2m + 1 + k_1 + k_2)$ and n is an integer, and

$$T(\theta) = (\cos \theta)^{k_3 + \frac{1}{2}} (\sin \theta)^\lambda P_l^{(\lambda, k_3)}(\cos 2\theta)$$

where $E = \frac{1}{2}[2(l + m + 1) + (k_1 + k_2 + k_3)]^2 - \frac{1}{8}$. The orthonormal basis eigenfunctions are

$$\Psi_{lm}(\theta, \varphi) = (\sin \theta)^{-1/2} \Phi_l^{(\lambda, k_3)}(\theta) \Phi_m^{(k_2, k_1)}(\varphi) \quad (68)$$

The operator which characterises this solution and separation is

$$L_1 \Psi = \left[\left(s_1 \frac{\partial}{\partial s_2} - s_2 \frac{\partial}{\partial s_1} \right)^2 + \left(\frac{1}{4} - k_1^2 \right) \frac{s_1^2 + s_2^2}{s_1^2} + \left(\frac{1}{4} - k_2^2 \right) \frac{s_1^2 + s_2^2}{s_2^2} \right] \Psi = \lambda^2 \Psi. \quad (69)$$

Note that after the multiplier $(\sin \varphi)^{k_2 + \frac{1}{2}} (\cos \varphi)^{k_1 + \frac{1}{2}} (\cos \theta)^{k_3 + \frac{1}{2}} (\sin \theta)^{k_1 + k_2 + 1} = \prod_{i=1}^3 s_i^{k_i + \frac{1}{2}}$ is split off, the eigenfunctions are polynomials in the variables s_2^2, s_3^2 . See [18, 16, 17, 24] for a complete discussion of the polynomial setting for this eigenvalue equation.

For the second coordinate system we choose Lamé coordinates given by

$$s_1^2 = \frac{(u_1 - e_1)(u_2 - e_1)}{(e_1 - e_2)(e_1 - e_3)}, \quad s_2^2 = \frac{(u_1 - e_2)(u_2 - e_2)}{(e_2 - e_1)(e_2 - e_3)}, \quad s_3^2 = \frac{(u_1 - e_3)(u_2 - e_3)}{(e_3 - e_1)(e_3 - e_2)}.$$

$$e_1 < u_1 < e_2 < u_2 < e_3$$

The Schrödinger equation written in terms of these coordinates is

$$\begin{aligned} & \frac{4}{(u_1 - u_2)} \left\{ (u_1 - e_1)(u_1 - e_2)(u_1 - e_3) \left[\frac{\partial^2 \Psi}{\partial u_1^2} + \frac{1}{2} \left(\frac{1}{u_1 - e_1} + \frac{1}{u_1 - e_2} + \frac{1}{u_1 - e_3} \right) \frac{\partial \Psi}{\partial u_1} \right] - \right. \\ & (u_2 - e_1)(u_2 - e_2)(u_2 - e_3) \left. \left[\frac{\partial^2 \Psi}{\partial u_2^2} - \frac{1}{2} \left(\frac{1}{u_2 - e_1} + \frac{1}{u_2 - e_2} + \frac{1}{u_2 - e_3} \right) \frac{\partial \Psi}{\partial u_2} \right] \right\} \\ & + \left[(k_1^2 - \frac{1}{4}) \frac{(e_1 - e_2)(e_1 - e_3)}{(u_1 - e_1)(u_2 - e_1)} + (k_2^2 - \frac{1}{4}) \frac{(e_2 - e_1)(e_2 - e_3)}{(u_1 - e_2)(u_2 - e_2)} \right. \\ & \left. + (k_3^2 - \frac{1}{4}) \frac{(e_3 - e_2)(e_3 - e_1)}{(u_1 - e_3)(u_2 - e_3)} \right] \Psi = 2E\Psi. \end{aligned} \quad (70)$$

The separation equations are

$$\begin{aligned} (\rho - e_1)(\rho - e_2)(\rho - e_3) \left[\frac{\partial \Psi^2}{\partial \rho^2} + \frac{1}{2} \left(\frac{1}{\rho - e_1} + \frac{1}{\rho - e_2} + \frac{1}{\rho - e_3} \right) \frac{\partial \Psi}{\partial \rho} \right] - \left[(k_1^2 - \frac{1}{4}) \frac{(e_1 - e_2)(e_1 - e_3)}{\rho - e_1} \right. \\ \left. + (k_2^2 - \frac{1}{4}) \frac{(e_2 - e_1)(e_2 - e_3)}{\rho - e_2} + (k_3^2 - \frac{1}{4}) \frac{(e_3 - e_2)(e_3 - e_1)}{\rho - e_3} + 2E\rho + \mu \right] \Psi = 0 \end{aligned} \quad (71)$$

where $\rho = u_1, u_2$. The operator whose eigenvalue is μ is

$$\begin{aligned} L_2 = \frac{-4}{(u_1 - u_2)} \left\{ u_2(u_1 - e_1)(u_1 - e_2)(u_1 - e_3) \left[\frac{\partial^2}{\partial u_1^2} + \frac{1}{2} \left(\frac{1}{u_1 - e_1} + \frac{1}{u_1 - e_2} + \frac{1}{u_1 - e_3} \right) \frac{\partial}{\partial u_1} \right] \right. \\ \left. - u_1(u_2 - e_1)(u_2 - e_2)(u_2 - e_3) \left[\frac{\partial^2}{\partial u_2^2} - \frac{1}{2} \left(\frac{1}{u_2 - e_1} + \frac{1}{u_2 - e_2} + \frac{1}{u_2 - e_3} \right) \frac{\partial}{\partial u_2} \right] \right\} \\ + \left[(k_1^2 - \frac{1}{4}) \frac{(e_1 - e_2)(e_1 - e_3)}{(u_1 - e_1)(u_2 - e_1)} (u_1 + u_2 - e_1) + (k_2^2 - \frac{1}{4}) \frac{(e_2 - e_1)(e_2 - e_3)}{(u_1 - e_2)(u_2 - e_2)} (u_1 + u_2 - e_2) \right. \\ \left. + (k_3^2 - \frac{1}{4}) \frac{(e_3 - e_2)(e_3 - e_1)}{(u_1 - e_3)(u_2 - e_3)} (u_1 + u_2 - e_3) \right]. \end{aligned} \quad (72)$$

Expressed in terms of coordinates on the sphere this has the form

$$\begin{aligned} L_2 = e_3 \left(s_1 \frac{\partial}{\partial s_2} - s_2 \frac{\partial}{\partial s_1} \right)^2 + e_2 \left(s_1 \frac{\partial}{\partial s_3} - s_3 \frac{\partial}{\partial s_1} \right)^2 + e_1 \left(s_3 \frac{\partial}{\partial s_2} - s_2 \frac{\partial}{\partial s_3} \right)^2 \\ + \left(\frac{1}{4} - k_1^2 \right) \left(\frac{e_2 s_2^2 + e_3 s_3^2}{s_1^2} + e_1 - e_2 - e_3 \right) + \left(\frac{1}{4} - k_2^2 \right) \left(\frac{e_1 s_1^2 + e_3 s_3^2}{s_2^2} + e_2 - e_1 - e_3 \right) \\ + \left(\frac{1}{4} - k_3^2 \right) \left(\frac{e_2 s_2^2 + e_1 s_1^2}{s_3^2} + e_3 - e_2 - e_1 \right). \end{aligned} \quad (73)$$

The eigenfunctions Ψ can be readily calculated from the Schrödinger equation (67). In order to find the bound state solutions we try a solution of the form [26]

$$\Psi = (\prod_{l=1}^3 s_l^{k_l + \frac{1}{2}}) \prod_{j=1}^n \left(\frac{s_1^2}{\theta_j - e_1} + \frac{s_2^2}{\theta_j - e_2} + \frac{s_3^2}{\theta_j - e_3} \right), \quad (74)$$

and observe that

$$\frac{s_1^2}{\theta_j - e_1} + \frac{s_2^2}{\theta_j - e_2} + \frac{s_3^2}{\theta_j - e_3} = \frac{\prod_{l=1}^3 (u_l - \theta_j)}{\prod_{m=1}^3 (\theta_j - e_m)}$$

For solutions, the zeros θ_p must satisfy the equations

$$\frac{k_1 + 1}{\theta_m - e_1} + \frac{k_2 + 1}{\theta_m - e_2} + \frac{k_3 + 1}{\theta_m - e_3} + \sum_{j \neq m} \frac{2}{\theta_m - \theta_j} = 0, \quad (75)$$

and the eigenvalues E and μ in this case are

$$E = \frac{1}{2}(2n + 2 + k_1 + k_2 + k_3)^2 - \frac{1}{8},$$

$$\mu = -2[k_1(e_2 + e_3) + k_2(e_1 + e_3) + k_3(e_2 + e_1) + e_3 k_1 k_2 + e_2 k_1 k_3 + e_1 k_2 k_3] - \frac{3}{2}(e_1 + e_2 + e_3)$$

$$-4e_2 e_3 (k_1 + 1) \sum_{m=1}^n \frac{1}{(\theta_m - e_1)} - 4e_1 e_3 (k_2 + 1) \sum_{m=1}^n \frac{1}{(\theta_m - e_2)} - 4e_1 e_2 (k_3 + 1) \sum_{m=1}^n \frac{1}{(\theta_m - e_3)}.$$

If we take the constants of the motion to be

$$H = M_{12}^2 + M_{13}^2 + M_{23}^2 + \frac{k_1^2 - \frac{1}{4}}{s_1^2} (s_2^2 + s_3^2) + \frac{k_2^2 - \frac{1}{4}}{s_2^2} (s_1^2 + s_3^2) + \frac{k_3^2 - \frac{1}{4}}{s_3^2} (s_2^2 + s_1^2),$$

$$L_1 = M_{12}^2 + (k_1^2 - \frac{1}{4}) \frac{s_2^2}{s_1^2} + (k_2^2 - \frac{1}{4}) \frac{s_1^2}{s_2^2},$$

$$L_2 = e_3 M_{12}^2 + e_2 M_{13}^2 + e_1 M_{32}^2 +$$

$$\frac{k_1^2 - \frac{1}{4}}{s_1^2} (e_3 s_2^2 + e_2 s_3^2) + \frac{k_2^2 - \frac{1}{4}}{s_2^2} (e_3 s_1^2 + e_1 s_3^2) + \frac{k_3^2 - \frac{1}{4}}{s_3^2} (e_1 s_2^2 + e_2 s_1^2),$$

where $M_{ik} = s_i \partial / \partial s_k - s_k \partial / \partial s_i$. The corresponding defining relations are

$$L_{12} = \{L_1, L_2\} = 4(e_1 - e_2)[M_{12} M_{13} M_{32} \quad (76)$$

$$- (k_1^2 - \frac{1}{4}) \frac{s_3 s_2}{s_1^2} M_{23} - (k_2^2 - \frac{1}{4}) \frac{s_3 s_1}{s_2^2} M_{31} - (k_3^2 - \frac{1}{4}) \frac{s_1 s_2}{s_3^2} M_{12},$$

$$L_{12}^2 = -16L_1[e_2 H + (e_3 - e_2)L_1 - L_2][e_1 H + (e_3 - e_1)L_1 - L_2]$$

$$-16(k_3^2 - \frac{1}{4})(e_1 - e_2)^2 L_1^2 - 16(k_1^2 - \frac{1}{4})[e_2 H + (e_3 - e_2)L_1 - L_2]^2$$

$$-16(k_2^2 - \frac{1}{4})[(e_1 H + (e_3 - e_1)L_1 - L_2)^2 - \frac{4}{3} \prod_{l=1}^3 (k_l^2 - \frac{1}{4})(e_1 - e_2)^2],$$

$$\{L_2, L_1\} = -(8L_1 + 16)(k_2^2 - \frac{1}{4})[e_1 H + (e_3 - e_1)L_1 - L_2]$$

$$-(8L_1 + 16)(k_1^2 - \frac{1}{4})[e_2 H + (e_3 - e_2)L_1 - L_2],$$

$$\{L_{12}, L_2\} = -8[e_2 H + (e_3 - e_2)L_1 - L_2][e_1 H + (e_3 - e_1)L_1 - L_2]$$

$$-8(e_2 - e_3)L_1[e_1 H + (e_3 - e_1)L_1 - L_2] - 8(e_1 - e_3)L_1[e_2 H + (e_3 - e_2)L_1 - L_2]$$

$$+ 16[(k_1^2 - \frac{1}{4})(e_3 - e_2) + (k_2^2 - \frac{1}{4})(e_3 - e_1)]L_2$$

$$-16[(k_1^2 - \frac{1}{4})(e_3 - e_2)^2 + (k_2^2 - \frac{1}{4})(e_3 - e_1)^2 + (k_3^2 - \frac{1}{4})(e_1 - e_2)^2]L_1$$

$$+ 16e_1(e_1 - e_3)(k_2^2 - \frac{1}{4}) + 16e_2(e_2 - e_3)H.$$

3.2 The second potential on the sphere is

$$V_2 = \frac{-\alpha s_3}{2\sqrt{s_1^2 + s_2^2}} + \frac{1}{4\sqrt{s_1^2 + s_2^2}} \left[\frac{k_1^2 - \frac{1}{4}}{\sqrt{s_1^2 + s_2^2 + s_1}} + \frac{k_2^2 - \frac{1}{4}}{\sqrt{s_1^2 + s_2^2 - s_1}} \right]. \quad (77)$$

In spherical coordinates the Schrödinger equation has the form

$$\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial \Psi}{\partial \theta} + \frac{1}{\sin^2 \theta} \frac{\partial^2 \Psi}{\partial \varphi^2} + \left[\frac{\alpha \cos \theta}{\sin \theta} + \frac{1}{2 \sin^2 \theta} \left(\frac{\frac{1}{4} - k_1^2}{1 + \cos \varphi} + \frac{\frac{1}{4} - k_2^2}{1 - \cos \varphi} \right) \right] \Psi = -2E\Psi.$$

This equation can be solved by a separation of variables via the substitution $\Psi = S(\theta)\Phi(\varphi)$ and the separation equations are

$$\frac{\partial^2 \Phi}{\partial \varphi^2} + \frac{1}{2} \left(\frac{\frac{1}{4} - k_1^2}{1 + \cos \varphi} + \frac{\frac{1}{4} - k_2^2}{1 - \cos \varphi} \right) \Phi = -\lambda^2 \Phi,$$

$$\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial S}{\partial \theta} + \left(\frac{\alpha \cos \theta}{\sin \theta} - \frac{\lambda^2}{\sin^2 \theta} \right) S = -2ES.$$

The solutions of the first equation are $\Phi_m^{(k_1, k_2)}(\varphi/2)$, see (20), where $\lambda = \frac{1}{2}(2m + k_1 + k_2 + 1)$. The solution of the θ separation equation is given by

$$S_{nm}(\theta) = \frac{2^{\lambda+1/2}}{\Gamma(2\lambda+1)} \sqrt{\frac{[\sigma^2 + (n + \lambda + 1/2)^2] \Gamma(n + 2\lambda + 1) \Gamma(i\sigma + \lambda + 1/2)}{(n + \lambda + 1/2)^2 n! \Gamma(i\sigma - \lambda + 1/2)}} \\ (\sin \theta)^{\lambda} e^{i\theta(i\sigma - n)} {}_2F_1(-n, i\sigma + \lambda + 1/2; 2\lambda + 1; 1 - e^{2i\theta}), \quad (78)$$

where $\sigma = \alpha/(n + \lambda + 1/2) = \alpha/[n + m + 1 + \frac{1}{2}(k_1 + k_2)]$, and the orthonormal eigenfunctions are

$$\Psi_{nm}(\theta, \varphi) = S_{nm}(\theta) \Phi_m^{(k_1, k_2)}(\varphi/2).$$

The operator which characterises the separable solutions in this coordinate system is

$$L_1 \Psi = \left[\left(s_1 \frac{\partial}{\partial s_2} - s_2 \frac{\partial}{\partial s_1} \right)^2 - \frac{(k_1^2 - 1/4)\sqrt{s_1^2 + s_2^2}}{2(\sqrt{s_1^2 + s_2^2} + s_1)} - \frac{(k_2^2 - 1/4)\sqrt{s_1^2 + s_2^2}}{2(\sqrt{s_1^2 + s_2^2} - s_1)} \right] \Psi = -\lambda^2 \Psi.$$

For the second coordinate system we must choose a variant of the standard elliptical coordinates [13]. A suitable choice is

$$s_1 = \cos f x_1 + \sin f x_3, \quad s_2 = x_2, \quad s_3 = -\sin f x_1 + \cos f x_3$$

where

$$x_1^2 = \frac{(y_1 - e_1)(y_2 - e_1)}{(e_1 - e_2)(e_1 - e_3)}, \quad x_2^2 = \frac{(y_1 - e_2)(y_2 - e_2)}{(e_2 - e_1)(e_2 - e_3)}, \quad x_3^2 = \frac{(y_1 - e_3)(y_2 - e_3)}{(e_3 - e_1)(e_3 - e_2)}, \\ e_1 < y_1 < e_2 < y_2 < e_3,$$

and

$$\sin f = \sqrt{\frac{e_2 - e_1}{e_3 - e_1}}, \quad \cos f = \sqrt{\frac{e_3 - e_2}{e_3 - e_1}}.$$

To see how this works it is convenient to define the new variables E_+ , E_- , Z_1 , Z_2 according to $e_2 = e_1 + \frac{1}{4}(E_+ + E_-)^2$, $e_3 = e_2 + \frac{1}{4}(E_+ - E_-)^2$, $y_j = e_2 + \frac{1}{4}(E_+^2 + E_-^2) + \frac{1}{4}E_+E_-(Z_j + \frac{1}{Z_j})$.

In terms of these variables Schrödinger's equation has the form

$$-\frac{4Z_1Z_2}{(Z_1 - Z_2)(Z_1Z_2 - 1)} \left\{ (Z_1 + \Omega_+)(Z_1 + \Omega_-)Z_1 \left[\frac{\partial^2 \Psi}{\partial Z_1^2} + \frac{1}{2} \left(\frac{1}{Z_1 + \Omega_+} + \frac{1}{Z_1 + \Omega_-} + \frac{1}{Z_1} \right) \frac{\partial \Psi}{\partial Z_1} \right] \right. \\ \left. - (Z_2 + \Omega_+)(Z_2 + \Omega_-)Z_2 \left[\frac{\partial^2 \Psi}{\partial Z_2^2} + \frac{1}{2} \left(\frac{1}{Z_2 + \Omega_+} + \frac{1}{Z_2 + \Omega_-} + \frac{1}{Z_2} \right) \frac{\partial \Psi}{\partial Z_2} \right] \right\} \\ + \left[\frac{2i\alpha(Z_1Z_2 + 1)}{(Z_1Z_2 - 1)} + (k_1^2 - \frac{1}{4}) \frac{(1 - \Omega_-^2)Z_1Z_2}{(Z_1Z_2 - 1)(Z_2 + \Omega_+)(Z_1 + \Omega_+)} + \right. \\ \left. (k_2^2 - \frac{1}{4}) \frac{(1 - \Omega_+^2)Z_1Z_2}{(Z_1Z_2 - 1)(Z_2 + \Omega_-)(Z_1 + \Omega_-)} \right] \Psi = -2E\Psi, \quad (79)$$

where $\Omega_+ = E_+/E_-$ and $\Omega_- = E_-/E_+$, so $\Omega_+\Omega_- = 1$. The separation equations are

$$4(Z_j + \Omega_+)(Z_j + \Omega_-)Z_j \left[\frac{\partial^2 \Psi}{\partial Z_j^2} + \frac{1}{2} \left(\frac{1}{Z_j + \Omega_+} + \frac{1}{Z_j + \Omega_-} + \frac{1}{Z_j} \right) \frac{\partial \Psi}{\partial Z_j} \right] \\ + \left[2(-i\alpha + E)Z_j + 2(i\alpha + E) \frac{1}{Z_j} + \frac{(k_1^2 - \frac{1}{4})(\Omega_-^2 - 1)}{Z_j + \Omega_-} + \frac{(k_2^2 - \frac{1}{4})(\Omega_+^2 - 1)}{Z_j + \Omega_+} + \mu \right] \Psi = 0.$$

In terms of the variables Z_j the operator which describes the separation is

$$L_2 = \frac{4}{(Z_1 - Z_2)(Z_1Z_2 - 1)} \left\{ -(Z_2 + 1)Z_1(Z_1 + \Omega_+)(Z_1 + \Omega_-) \left[\frac{\partial^2}{\partial Z_1^2} \right. \right. \\ \left. \left. + \frac{1}{2} \left(\frac{1}{Z_1 + \Omega_+} + \frac{1}{Z_1 + \Omega_-} + \frac{1}{Z_1} \right) \frac{\partial}{\partial Z_1} \right] + (Z_1 + 1)Z_2(Z_2 + \Omega_+)(Z_2 + \Omega_-) \left[\frac{\partial^2}{\partial Z_2^2} \right. \right. \\ \left. \left. + \frac{1}{2} \left(\frac{1}{Z_2 + \Omega_+} + \frac{1}{Z_2 + \Omega_-} + \frac{1}{Z_2} \right) \frac{\partial}{\partial Z_2} \right] \right\} \\ + \left[\frac{(1 - \Omega_-^2)[Z_1Z_2(Z_1 + Z_2) + \Omega_-(Z_1Z_2 - 1)]}{(Z_1Z_2 - 1)(Z_1 + \Omega_-)(Z_2 + \Omega_-)} (k_1^2 - \frac{1}{4}) \right. \\ \left. + \frac{(1 - \Omega_+^2)[Z_1Z_2(Z_1 + Z_2) + \Omega_+(Z_1Z_2 - 1)]}{(Z_1Z_2 - 1)(Z_1 + \Omega_+)(Z_2 + \Omega_+)} (k_2^2 - \frac{1}{4}) + \frac{4i\alpha(Z_1 + Z_2)}{Z_1Z_2 - 1} \right]. \quad (80)$$

Indeed if we consider the elliptical coordinates

$$U_3^2 = Z_1Z_2, \quad U_1^2 = \frac{(Z_1 + \Omega_-)(Z_2 + \Omega_-)}{\Omega_-^2 - 1}, \quad U_2^2 = \frac{(Z_1 + \Omega_+)(Z_2 + \Omega_+)}{\Omega_+^2 - 1}, \quad (81)$$

then putting $k_3 = \sqrt{\frac{1}{4} + 2(E - i\alpha)}$ and $\tilde{E} = i\alpha + E$ and multiplying the Schrödinger equation by $(\frac{1}{Z_1Z_2} - 1)$ we see that the resulting equation has the form

$$H\Psi = \frac{\partial^2 \Psi}{\partial U_1^2} + \frac{\partial^2 \Psi}{\partial U_2^2} + \frac{\partial^2 \Psi}{\partial U_3^2} - \left(U_1 \frac{\partial}{\partial U_1} + U_2 \frac{\partial}{\partial U_2} + U_3 \frac{\partial}{\partial U_3} \right)^2 \Psi \\ - \left(U_1 \frac{\partial \Psi}{\partial U_1} + U_2 \frac{\partial \Psi}{\partial U_2} + U_3 \frac{\partial \Psi}{\partial U_3} \right) + \left(2\tilde{E} + \frac{\frac{1}{4} - k_1^2}{U_1^2} + \frac{\frac{1}{4} - k_2^2}{U_2^2} + \frac{\frac{1}{4} - k_3^2}{U_3^2} \right) \Psi = 0. \quad (82)$$

We recognise this as equation (67) that we obtained in the case of the potential V_1 . Thus the solutions are of the form

$$\Psi = (\prod_{\ell=1}^3 U_{\ell}^{k_{\ell} + \frac{1}{2}}) \prod_{j=1}^q \left(\frac{U_1^2}{\theta_j - e_1} + \frac{U_2^2}{\theta_j - e_2} + \frac{U_3^2}{\theta_j - e_3} \right). \quad (83)$$

The zeros θ_p satisfy the equations

$$\frac{k_1 + 1}{\theta_m + \Omega_-} + \frac{k_2 + 1}{\theta_m + \Omega_+} + \frac{\sqrt{\frac{1}{4} + 2(E - i\alpha)} + 1}{\theta_m} + \sum_{j \neq m} \frac{2}{\theta_m - \theta_j} = 0, \quad (84)$$

and the eigenvalues E and μ are determined by

$$\begin{aligned} E &= \frac{1}{2} \left(2q + 2 + k_1 + k_2 + \sqrt{\frac{1}{4} + 2(E - i\alpha)} \right)^2 - \frac{1}{8}, \\ \mu &= 2 \left[\Omega_- (k_2 + \sqrt{\frac{1}{4} + 2(E - i\alpha)}) + \Omega_+ (k_1 + \sqrt{\frac{1}{4} + 2(E - i\alpha)}) \right] \\ &\quad + 2[\Omega_+ k_1 + \Omega_- k_2] \sqrt{\frac{1}{4} + 2(E - i\alpha)} + \frac{3}{2}(\Omega_+ + \Omega_-) \\ &\quad + \sqrt{\frac{1}{4} + 2(E - i\alpha)} \left[4\Omega_+ (k_1 + 1) \sum_{m=1}^q \frac{1}{(\theta_m + \Omega_-)} + 4\Omega_- (k_2 + 1) \sum_{m=1}^q \frac{1}{(\theta_m + \Omega_+)} \right] \\ &\quad - 4\Omega_+ \Omega_- \left(\sqrt{\frac{1}{4} + 2(E - i\alpha)} + 1 \right) \sum_{m=1}^q \frac{1}{\theta_m}. \end{aligned} \quad (85)$$

The classical constants of the motion associated with this potential are

$$\begin{aligned} H &= -\frac{4Z_1 Z_2}{(Z_1 - Z_2)(Z_1 Z_2 - 1)} \left[(Z_1 + \Omega_+)(Z_1 + \Omega_-) Z_1 P_{Z_1}^2 \right. \\ &\quad \left. - (Z_2 + \Omega_+)(Z_2 + \Omega_-) Z_2 P_{Z_2}^2 \right] \\ &\quad + \left[\frac{2i\alpha(Z_1 Z_2 + 1)}{(Z_1 Z_2 - 1)} + (k_1^2 - \frac{1}{4}) \frac{(1 - \Omega_-^2) Z_1 Z_2}{(Z_1 Z_2 - 1)(Z_2 + \Omega_+)(Z_1 + \Omega_+)} \right. \\ &\quad \left. + (k_2^2 - \frac{1}{4}) \frac{(1 - \Omega_+^2) Z_1 Z_2}{(Z_1 Z_2 - 1)(Z_2 + \Omega_-)(Z_1 + \Omega_-)} \right], \\ L_2 &= \frac{4}{(Z_1 - Z_2)(Z_1 Z_2 - 1)} \left[-(Z_2 + 1) Z_1 (Z_1 + \Omega_+) (Z_1 + \Omega_-) P_{Z_1}^2 \right. \\ &\quad \left. + (Z_1 + 1) Z_2 (Z_2 + \Omega_+) (Z_2 + \Omega_-) P_{Z_2}^2 \right] \\ &\quad + \frac{(1 - \Omega_-^2)(Z_1 Z_2 (Z_1 + Z_2) + \Omega_- (Z_1 Z_2 - 1))}{(Z_1 Z_2 - 1)(Z_1 + \Omega_-)(Z_2 + \Omega_-)} (k_1^2 - \frac{1}{4}) \\ &\quad + \frac{(1 - \Omega_+^2)(Z_1 Z_2 (Z_1 + Z_2) + \Omega_+ (Z_1 Z_2 - 1))}{(Z_1 Z_2 - 1)(Z_1 + \Omega_+)(Z_2 + \Omega_+)} (k_2^2 - \frac{1}{4}) + \frac{4i\alpha(Z_1 + Z_2)}{Z_1 Z_2 - 1} \end{aligned}$$

$$= (\Omega_+ + \Omega_-)(M_{12}^2 - M_{13}^2 - M_{23}^2) - 2i(\Omega_- - \Omega_+) M_{12} M_{13}$$

$$\begin{aligned} &+ \left[\frac{\Omega_+ (s_3 - is_1) + \Omega_- (s_3 + is_1)}{\sqrt{s_1^2 + s_2^2}} \right] \alpha \\ &+ \frac{k_1^2 - \frac{1}{4}}{2(\sqrt{s_1^2 + s_2^2} + s_1)} \left[\frac{\Omega_+ (s_3 - is_1) + \Omega_- (s_3 + is_1)}{\sqrt{s_1^2 + s_2^2}(\sqrt{s_1^2 + s_2^2} - s_3)} + \Omega_- (\sqrt{s_1^2 + s_2^2} + is_3) \right] \\ &+ \frac{k_2^2 - \frac{1}{4}}{2(\sqrt{s_1^2 + s_2^2} - s_1)} \left[\frac{\Omega_+ (s_3 - is_1) + \Omega_- (s_3 + is_1)}{\sqrt{s_1^2 + s_2^2}(\sqrt{s_1^2 + s_2^2} - s_3)} + \Omega_+ (\sqrt{s_1^2 + s_2^2} + is_3) \right], \\ L_1 &= -\frac{(Z_1 + \Omega_+)(Z_1 + \Omega_-)(Z_2 + \Omega_+)(Z_2 + \Omega_-)}{(Z_1 - Z_2)^2} (Z_1 P_{Z_1} - Z_2 P_{Z_2})^2 \\ &+ \frac{1}{4} (k_2^2 - \frac{1}{4}) \frac{(\Omega_+^2 - 1)(Z_1 Z_2 - 1)}{(Z_1 + \Omega_+)(Z_2 + \Omega_+)} + \frac{1}{4} (k_1^2 - \frac{1}{4}) \frac{(\Omega_-^2 - 1)(Z_1 Z_2 - 1)}{(Z_1 + \Omega_-)(Z_2 + \Omega_-)} \\ &= M_{12}^2 - \frac{1}{2} \left[\frac{\sqrt{s_1^2 + s_2^2}}{\sqrt{s_1^2 + s_2^2} + s_1} (k_1^2 - \frac{1}{4}) + \frac{\sqrt{s_1^2 + s_2^2}}{\sqrt{s_1^2 + s_2^2} - s_1} (k_2^2 - \frac{1}{4}) \right]. \end{aligned}$$

The corresponding defining relations for the quadratic algebra are

$$\begin{aligned} L_{12}^2 &= -64L_1^2 - 4(\Omega_+ + \Omega_-)^2 H^2 L_1 + 64HL_2^2 + 16(\Omega_+ + \Omega_-) L_3 L_2^2 \\ &\quad - 4L_1 L_2^2 - 8(\Omega_+ + \Omega_-) L_1 L_2 H + (\Omega_+ - \Omega_-) \\ &\quad - 4[\Omega_- (4k_1^2 - 1) - \Omega_+ (4k_2^2 - 1)] L_1^2 - 4[\Omega_- (1 - k_2^2 - 3k_1^2) - \Omega_+ (1 - k_1^2 - 3k_2^2)] H L_1 \\ &\quad + 4(k_1^2 - k_2^2) L_1 L_2 - 4i\alpha(k_1^2 - k_2^2) L_2 + 8i\alpha(\Omega_- (k_2^2 - k_1^2 - 2i\alpha) + \Omega_+ (k_1^2 - k_2^2 + 2i\alpha)) L_1 \\ &\quad - (k_1^2 - k_2^2)(\Omega_- (k_2^2 - k_1^2 + 4i\alpha) + \Omega_+ (k_1^2 - k_2^2 + 4i\alpha)) H \\ &\quad + 2i\alpha(\Omega_+ - \Omega_-)((k_1^2 - k_2^2)^2 + 2i\alpha(2(k_1^2 + k_2^2) - 1)), \\ \{L_{12}, L_1\} &= 8(\Omega_+ + \Omega_-) L_1^2 - 4L_1 L_2 - 4(\Omega_+ + \Omega_-) L_1 H + 2(k_1^2 - k_2^2) L_1 \\ &\quad - 2i\alpha(k_1^2 - k_2^2)(\Omega_+ - \Omega_-), \\ \{L_{12}, L_2\} &= -2(\Omega_+ + \Omega_-)^2 H^2 - 96L_1^2 - 2L_2^2 + 16L_2 L_1 - 4(\Omega_+ + \Omega_-) L_2 H \\ &\quad + L_1 H(\Omega_+ - \Omega_-)[-2(\Omega_+ (k_1^2 + 3k_2^2 - 1) - \Omega_- (k_2^2 + 3k_1^2 - 1))] H \\ &\quad - 4[\Omega_+ (1 - 4k_2^2) - \Omega_- (1 - 4k_1^2)] L_1 + 4i\alpha((k_1^2 - k_2^2)(\Omega_+ - \Omega_-) + 2i\alpha(\Omega_+ - \Omega_-)). \end{aligned}$$

4 The n -dimensional isotropic oscillator

It is well known that the quantum isotropic harmonic oscillator can be solved by the method of separation of variables in a number of coordinate systems, including cartesian coordinates and elliptical coordinates, e.g., [3, 15]. We present a new derivation of the eigenfunctions associated with *elliptic coordinates*. We will adopt the convention of defining this equation by

$$H\Psi = [-\frac{1}{2}\Delta + \frac{1}{2}\omega^2(x_1^2 + \dots + x_n^2)]\Psi = E\Psi \quad (86)$$

where $\Delta = \partial_{x_1}^2 + \dots + \partial_{x_n}^2$. Elliptical coordinates in Euclidean n space are defined by

$$x_j^2 = \frac{\prod_{\ell=1}^n (u_{\ell} - e_j)}{\prod_{k \neq j} (e_k - e_j)} \quad (87)$$

for $e_1 < u_1 < e_2 < \dots < e_n < u_n$. To obtain polynomial solutions of this equation in these coordinates we note the identity

$$\sum_{k=1}^n \frac{x_k^2}{\theta - e_k} - 1 = -\frac{\prod_{h=1}^n (\theta - u_h)}{\prod_{l=1}^n (\theta - e_l)}.$$

If we rewrite equation (86) in terms of Φ where $\Psi = \exp[-\omega^2 r^2/2]\Phi$ and r is the radial coordinate, we obtain the eigenvalue equation

$$[\Delta - 2\omega(\sum_{m=1}^n x_m \partial_{x_m}) - n\omega]\Phi = -2E\Phi. \quad (88)$$

Note that the operator on the left-hand side maps polynomials in the variables x_j to polynomials, without increasing the order. For this equation we look for solutions of the form

$$\Phi = \prod_{l=1}^n x_l^{\alpha_l} \zeta(x_1, \dots, x_n)$$

where $\alpha_l = 0$ or 1. The equation for ζ is then

$$[\Delta + \sum_{m=1}^n (\frac{2\alpha_m}{x_m} \partial_{x_m} - 2\omega x_m \partial_{x_m})]\zeta = (-2E + n\omega + 2\omega \sum_{l=1}^n \alpha_l)\zeta.$$

We now look for solutions of the form

$$\zeta = \prod_{m=1}^n [\sum_{k=1}^n \frac{x_k^2}{\theta_m - e_k} - 1]. \quad (89)$$

Substituting this ansatz into the equation for ζ we obtain the requirements

$$\sum_{k=1}^n \frac{1 + 2\alpha_k}{\theta_l - e_k} + \sum_{j \neq l} \frac{4}{\theta_l - \theta_j} = -2\omega, \quad E = \omega(2m + \frac{n}{2} + \sum_{p=1}^n \alpha_p). \quad (90)$$

The operators which describe the separation constants are

$$\Lambda_j = \sum_{k \neq l} S_{j-1}^{kl} M_{kl}^2 + \sum_{l \neq j} S_j^l Q_{ul}, \quad j = 1 \dots n-1,$$

where $M_{kl} = x_k \partial_{x_l} - x_l \partial_{x_k}$, and

$$Q_{ik} = \partial_{x_i} \partial_{x_k} - \omega^2 x_i x_k, \quad S_j^{kl} = \frac{1}{j!} \sum_{i_1, \dots, i_j} e_{i_1} \dots e_{i_j},$$

where $i_m \neq i_{m'}$, $i_m \neq k, l$ for $m \neq m'$ and $m, m' = 1 \dots j$, and

$$S_j^k = S_j^k[e_1, \dots, e_n] = \frac{1}{j!} \sum_{i_1, \dots, i_j} e_{i_1} \dots e_{i_j}, \quad i_1, \dots, i_j \neq k,$$

where $i_m \neq i_{m'}$, $i_m \neq k$ for $m \neq m'$ and $m, m' = 1 \dots j$. In coordinate form these operators are

$$\Lambda_j = \sum_{k=1}^n \frac{S_j^k[u_1, \dots, u_n]}{\prod_{l \neq k} (u_l - u_k)} \left(4\sqrt{\prod_{l=1}^n (u_k - e_l)} \partial_{u_k} \sqrt{\prod_{l=1}^n (u_k - e_l)} \partial_{u_k} - \omega^2 \prod_{l=1}^n (u_k - e_l) \right). \quad (91)$$

They have the eigenvalues

$$\sum_l S_j^l \left[\omega(2\alpha_l + 1) - \sum_{m=1}^n \frac{2(\alpha_l + 1)}{\theta_m - e_l} \right]. \quad (92)$$

These operators form a closed algebra under the commutation relations

$$\begin{aligned} [M_{kl}, M_{ij}] &= M_{ij} \delta_{ki} + M_{ki} \delta_{lj} - M_{kj} \delta_{li} - M_{li} \delta_{kj} \\ [Q_{ik}, Q_{jl}] &= \omega^2 [M_{ij} \delta_{lk} + M_{il} \delta_{jk} + M_{kj} \delta_{li} + M_{kl} \delta_{ji}] \\ [Q_{ik}, M_{jl}] &= Q_{ij} \delta_{kl} + Q_{kj} \delta_{li} + Q_{il} \delta_{kj} + Q_{kl} \delta_{ij} \end{aligned}$$

The eigenfunctions can be normalised by using their representation in terms of cartesian coordinates. For the assumed form of the eigenfunctions given above the norm N is readily calculated to be

$$\begin{aligned} N^2 &= \sum_{p=0}^n \sum_{s_1, s_2, \dots, s_p} \sum_{i_1, \dots, i_p \neq j} (-1)^p \omega^{-\frac{n}{2} + \sum_{h=1}^n \alpha_h} \\ &\times \frac{\prod_{j=1}^n [(-\omega)^{-s_j} \Gamma(\alpha_j + s_j + \frac{1}{2})] \prod_{k=p+1}^n \Gamma(\alpha_k + \frac{1}{2})}{\prod_{r=1}^p \prod_{l_r}^{s_r} (\theta_{i_r, l_r} - e_{i_r})}, \end{aligned} \quad (93)$$

where $0 \leq s_j \leq 2q$, $0 \leq \sum_{j=1}^p s_j \leq 2q$, $0 \leq p \leq n$. Each of the s_j are integers, $\theta_{i_r, l_r} \in \{\theta_1, \dots, \theta_m\}$ and $\theta_{i_r, l_r} \neq \theta_{j_w, l_w}$ if $i_r \neq j_w$, and if i_r is fixed then at most two θ_{i_r, l_r} can be equal. From these results we have the satisfactory situation that both the eigenvalues and the normalisations can be computed in terms of the zeros $\theta_1, \dots, \theta_m$.

As an example of the simplest normalised eigenfunction we give the following:

$$\begin{aligned} \Psi &= \sqrt{\frac{\omega}{\pi}} \left[\frac{3}{4\omega^2} \left(\frac{1}{(\theta - e_1)^2} + \frac{1}{(\theta - e_2)^2} \right) + \frac{1}{2\omega^2(\theta - e_1)(\theta - e_2)} + 1 \right]^{-1/2} \\ &\times e^{-(x^2 + y^2)/2} \left[\frac{x^2}{\theta - e_1} + \frac{y^2}{\theta - e_2} - 1 \right]. \end{aligned}$$

For this eigenfunction the variable θ is a solution of

$$\frac{1}{(\theta - e_1)} + \frac{1}{(\theta - e_2)} = 0,$$

i.e., $\theta = (e_1 + e_2)/2$. If we substitute this into the above equations we obtain

$$\Psi = \sqrt{\frac{\omega}{\pi}} \left[\left(\frac{2}{\omega(e_1 - e_2)} \right)^2 + 1 \right]^{-1/2} e^{-\omega^2(x^2 + y^2)/2} \left[\frac{2(x^2 - y^2)}{(e_2 - e_1)} - 1 \right].$$

The orthonormalised eigenfunctions calculated in this way form a complete set.

In this paper we have established that once the zeros of a given set of special eigenfunctions, which are essentially polynomials, are known then all the other properties such as normalisation and eigenvalues can be determined from them in terms of algebraic expressions.

Суперинтегрируемость в двумерном евклидовом пространстве
и присоединенные полиномиальные решения

Рассмотрены базисные функции для тех двумерных классических и квантовомеханических систем, которые допускают полное разделение переменных, по крайней мере, в двух системах координат. Мы делаем это для соответствующих систем, определенных в двумерном евклидовом пространстве и на двумерной сфере. Мы представляем все эти случаи с единой точки зрения. В частности, все специальные функции, которые возникают в результате разделения переменных, имеют особые свойства, которые определяются нулями этих функций. Принципиально новыми результатами являются детали полиномиальных базисов для каждого неподгрупповых базисов, не только для случаев декартовых и полярных координат, а также детали структуры квадратичных алгебр. Мы также исследовали полиномиальные собственные функции в эллиптических координатах для n -мерного изотропного квантового осциллятора.

Работа выполнена в Лаборатории теоретической физики им. Н.Н.Боголюбова ОИЯИ.

Superintegrability in Two-Dimensional Euclidean Space
and Associated Polynomial Solutions

In this work we examine the basis functions for those classical and quantum mechanical systems in two dimensions which admit separation of variables in at least two coordinate systems. We do this for the corresponding systems defined in Euclidean space and on the two dimensional sphere. We present all of these cases from a unified point of view. In particular, all of the spectral functions that arise via variable separation have their essential features expressed in terms of their zeros. The principal new results are the details of the polynomial bases for each of the nonsubgroup bases, not just the subgroup cartesian and polar coordinate cases, and the details of the structure of the quadratic algebras. We also study the polynomial eigenfunctions in elliptic coordinates of the n -dimensional isotropic quantum oscillator.

The investigation has been performed at the Bogoliubov Laboratory of Theoretical Physics, JINR.
